**Abstract:** In this paper, a new class of sets called regular generalized  $\eta$ -closed (briefly  $rg\eta$ -closed) sets is introduced and its properties are studied. The relationships among closed,  $\alpha$ -closed,  $s$ -closed,  $\eta$ -closed,  $rg\eta$ -closed and their generalized closed sets are investigated. Several examples are provided to illustrate the behavior of these new class of sets.

**2010 AMS Subject Classification:** 54A05, 54A10

**Keywords:**  $\eta$ -closed,  $g\eta$ -closed,  $\pi g\eta$ -closed and  $rg\eta$ -closed sets.

## 1. Introduction

Many investigations related to generalized closed sets have been published in various forms of closed sets. In 1937, Stone [12] introduced the notion of regular open sets. In 1963, Levine [7] introduced the concept of semi-open sets. In 1965, Njastad [11] introduced the concept of  $\alpha$ -open sets. In 1968, the notion of  $\pi$ -open sets were introduced by Zaitsev [16] which are weaker form of regular open sets in topological spaces. In 1970, Levine [8] initiated the study of so called generalized closed (briefly  $g$ -closed) sets. In 1994, Maki et al. [9, 10] introduced the notion of  $\alpha g$ -closed sets. In 2000, Dontchev and Noiri [4] introduced the notion of  $\pi g$ -closed sets. In 2007, Arockiarani and Janaki [2] introduced the notion of  $\pi g\alpha$ -closed sets in topological spaces. In 2019, Subbulakshmi, Sumathi, Indirani [14, 15] introduced and investigated the notion of  $\eta$ -open and  $g\eta$ -closed sets. In 2019, Kumar and Sharma [5] introduced and investigated the notion of  $\eta$ - $T_k$  ( $k = 0, 1, 2$ ) and  $\eta$ - $R_k$  ( $k = 0, 1, 2$ ) axioms in topological spaces. Recently, Kumar [6] introduced and investigated the notion of  $\pi g\eta$ -closed sets.

## 2. Preliminaries

Throughout this paper, spaces  $(X, \mathfrak{S})$ ,  $(Y, \sigma)$ , and  $(Z, \gamma)$  (or simply  $X$ ,  $Y$  and  $Z$ ) always mean topological spaces on which no separation axioms are assumed unless explicitly stated. Let  $A$  be a subset of a space  $X$ . The closure of  $A$  and interior of  $A$  are denoted by  $cl(A)$  and  $int(A)$  respectively. A subset  $A$  is said to be **regular open** [12] (resp. **regular closed** [12]) if  $A = int(cl(A))$  (resp.  $A = cl(int(A))$ ). The finite union of regular open sets is said to be  **$\pi$ -open** [16]. The complement of a  $\pi$ -open set is said to be  **$\pi$ -closed** [16].

**Definition 2.1.** A subset  $A$  of a topological space  $(X, \mathfrak{S})$  is said to be

- (i)  **$s$ -open** [7] if  $A \subset cl(int(A))$ .
- (ii)  **$\alpha$ -open** [11] if  $A \subset int(cl(int(A)))$ .
- (iii)  **$\eta$ -open** [14] if  $A \subset in(cl(int(A))) \cup cl(int(A))$ .
- (iv)  **$\eta$ -closed** [14] if  $A \supset cl(int(cl(A))) \cup int(cl(A))$ .

The complement of a  $s$ -open (resp.  $\alpha$ -open,  $\eta$ -open) set is called  **$s$ -closed** (resp.  **$\alpha$ -closed**,  **$\eta$ -closed**). The intersection

of all  $s$ -closed (resp.  $\alpha$ -closed,  $\eta$ -closed) sets containing  $A$ , is called  **$s$ -closure** (resp.  **$\alpha$ -closure**,  **$\eta$ -closure**) of  $A$ , and is denoted by  **$s-cl(A)$**  (resp.  **$\alpha-cl(A)$** ,  **$\eta-cl(A)$** ). The  **$\eta$ -interior** of  $A$ , denoted by  **$\eta-int(A)$**  is defined as union of all  $\eta$ -open sets contained in  $A$ . We denote the family of all  $\eta$ -open (resp.  $\eta$ -closed) sets of a topological space by  **$\eta-O(X)$**  (resp.  **$\eta-C(X)$** ).

**Definition 2.2.** A subset  $A$  of a space  $(X, \mathfrak{S})$  is said to be

- (1) **generalized closed** (briefly  **$g$ -closed**) [8] if  $cl(A) \subset U$  whenever  $A \subset U$  and  $U \in \mathfrak{S}$ .
- (2)  **$\pi g$ -closed** [4] if  $cl(A) \subset U$  whenever  $A \subset U$  and  $U$  is  $\pi$ -open in  $X$ .
- (3)  **$rg$ -closed** [4] if  $cl(A) \subset U$  whenever  $A \subset U$  and  $U$  is regular open in  $X$ .
- (4)  **$\alpha$ -generalized closed** (briefly  **$\alpha g$ -closed**) [9, 10] if  $\alpha-cl(A) \subset U$  whenever  $A \subset U$  and  $U \in \mathfrak{S}$ .
- (5)  **$\pi g\alpha$ -closed** [2] if  $\alpha-cl(A) \subset U$  whenever  $A \subset U$  and  $U$  is  $\pi$ -open in  $X$ .
- (6)  **$gar$ -closed** [13] if  $\alpha-cl(A) \subset U$  whenever  $A \subset U$  and  $U$  is regular open in  $X$ .
- (7) **generalized semi-closed** (briefly  **$gs$ -closed**) [1] if  $s-cl(A) \subset U$  whenever  $A \subset U$  and  $U \in \mathfrak{S}$ .
- (8)  **$\pi gs$ -closed** [3] if  $s-cl(A) \subset U$  whenever  $A \subset U$  and  $U$  is  $\pi$ -open in  $X$ .
- (9)  **$rgs$ -closed** if  $s-cl(A) \subset U$  whenever  $A \subset U$  and  $U$  is regular open in  $X$ .
- (10) **generalized  $\eta$ -closed** (briefly  **$g\eta$ -closed**) [15] if  $\eta-cl(A) \subset U$  whenever  $A \subset U$  and  $U \in \mathfrak{S}$ .
- (11)  **$\pi g\eta$ -closed** (briefly  **$g\eta$ -closed**) [6] if  $\eta-cl(A) \subset U$  whenever  $A \subset U$  and is  $\pi$ -open in  $X$ .
- (12)  **$g$ -open** (resp.  **$\pi g$ -open**,  **$rg$ -open**,  **$\alpha g$ -open**,  **$\pi g\alpha$ -open**,  **$gar$ -open**,  **$gs$ -open**,  **$\pi gs$ -open**,  **$rgs$ -open**,  **$g\eta$ -open**,  **$\pi g\eta$ -open**) set if the complement of  $A$  is  $g$ -closed (resp.  $\pi g$ -closed,  $rg$ -closed,  $\alpha g$ -closed,  $\pi g\alpha$ -closed,  $gar$ -closed,  $gs$ -closed,  $\pi gs$ -closed,  $rgs$ -closed,  $g\eta$ -closed,  $\pi g\eta$ -closed).

## 3. Regular Generalized $\eta$ -closed Sets

**Definition 3.1.** A subset  $A$  of a space  $(X, \mathfrak{S})$  is said to be **regular generalized  $\eta$ -closed** (briefly  **$rg\eta$ -closed**) if  $\eta-cl(A) \subset U$  whenever  $A \subset U$  and  $U$  is regular open in  $X$ . The family of all  $rg\eta$ -closed subsets of  $X$  will be denoted by

$rg\eta$ -C(X).

**Theorem 3.2.** Every closed set is  $rg\eta$ -closed.

**Proof.** Let A be a closed set in X. Let U be a regular open set in X such that  $A \subset U$ . Since A is closed, that is,  $cl(A) = A$ ,  $cl(A) \subset U$ . But we have  $\eta-cl(A) \subset cl(A) \subset U$ . Therefore  $\eta-cl(A) \subset U$ . Hence A is  $rg\eta$ -closed in X.

**Theorem 3.3.** For a topological space X the followings hold:

- (1) Every g-closed set is  $rg\eta$ -closed.
- (2) Every  $\pi g$ -closed set is  $rg\eta$ -closed.
- (3) Every rg-closed set is  $rg\eta$ -closed.
- (4) Every  $\alpha$ -closed set is  $rg\eta$ -closed.
- (5) Every  $\alpha g$ -closed set is  $rg\eta$ -closed.
- (6) Every  $\pi g\alpha$ -closed set is  $rg\eta$ -closed.
- (7) Every  $g\alpha$ -closed set is  $rg\eta$ -closed.
- (8) Every s-closed set is  $rg\eta$ -closed.
- (9) Every gs-closed set is  $rg\eta$ -closed.
- (10) Every  $\pi gs$ -closed set is  $rg\eta$ -closed.
- (11) Every rgs-closed set is  $rg\eta$ -closed.
- (12) Every  $\eta$ -closed set is  $rg\eta$ -closed.
- (13) Every  $g\eta$ -closed set is  $rg\eta$ -closed.
- (14) Every  $\pi g\eta$ -closed set is  $rg\eta$ -closed.

**Proof.**

(1) Let A be a g-closed set in X. Let U be a regular open set in X such that  $A \subset U$ . Since every regular open set is open and since A is g-closed, that is,  $cl(A) \subset U$ . But we have  $\eta-cl(A) \subset cl(A) \subset U$ . Therefore  $\eta-cl(A) \subset U$ . Hence A is  $rg\eta$ -closed in X.

(2) Let A be a  $\pi g$ -closed set in X. Let U be a regular open set in X such that  $A \subset U$ . Since every regular open set is  $\pi$ -open and since A is  $\pi g$ -closed, that is,  $cl(A) \subset U$ . But we have  $\eta-cl(A) \subset cl(A) \subset U$ . Therefore  $\eta-cl(A) \subset U$ . Hence A is  $rg\eta$ -closed in X.

(3) Let A be a rg-closed set in X. Let U be a regular open set in X such that  $A \subset U$ . Since A is rg-closed, that is,  $cl(A) \subset U$ . But we have  $\eta-cl(A) \subset cl(A) \subset U$ . Therefore  $\eta-cl(A) \subset U$ . Hence A is  $rg\eta$ -closed in X.

(4) Let A be a  $\alpha$ -closed set in X. Let U be a regular open set in X such that  $A \subset U$ . Since A is  $\alpha$ -closed, that is,  $\alpha-cl(A) = A$ ,  $\alpha-cl(A) \subset U$ . But we have  $\eta-cl(A) \subset \alpha-cl(A) \subset U$ . Therefore  $\eta-cl(A) \subset U$ . Hence A is  $rg\eta$ -closed in X.

(5) Let A be a  $\alpha g$ -closed set in X. Let U be a regular open set in X such that  $A \subset U$ . Since every regular open set is open and since A is  $\alpha g$ -closed, that is,  $\alpha-cl(A) \subset U$ . But we have  $\eta-cl(A) \subset \alpha-cl(A) \subset U$ . Therefore  $\eta-cl(A) \subset U$ . Hence A is  $rg\eta$ -closed in X.

(6) Let A be a  $\pi g\alpha$ -closed set in X. Let U be a regular open set in X such that  $A \subset U$ . Since every regular open set is  $\pi$ -open and since A is  $\pi g\alpha$ -closed, that is,  $\alpha-cl(A) \subset U$ . But we have  $\eta-cl(A) \subset \alpha-cl(A) \subset U$ . Therefore  $\eta-cl(A) \subset U$ . Hence A is  $rg\eta$ -closed in X.

(7) Let A be a  $g\alpha$ -closed set in X. Let U be a regular open set in X such that  $A \subset U$ . Since A is  $g\alpha$ -closed, that is,  $\alpha-cl(A) \subset U$ . But we have  $\eta-cl(A) \subset \alpha-cl(A) \subset U$ . Therefore  $\eta-cl(A) \subset U$ . Hence A is  $rg\eta$ -closed in X.

(8) Let A be a s-closed set in X. Let U be a regular open set in X such that  $A \subset U$ . Since A is s-closed, that is,  $s-cl(A) = A$ ,  $s-cl(A) \subset U$ . But we have  $\eta-cl(A) \subset s-cl(A) \subset U$ . Therefore  $\eta-cl(A) \subset U$ . Hence A is  $rg\eta$ -closed in X.

(9) Let A be a gs-closed set in X. Let U be a regular open set in X such that  $A \subset U$ . Since every regular open set is open and since A is gs-closed, that is,  $s-cl(A) \subset U$ . But we have  $\eta-cl(A) \subset s-cl(A) \subset U$ . Therefore  $\eta-cl(A) \subset U$ . Hence A is  $rg\eta$ -closed in X.

(10) Let A be a  $\pi gs$ -closed set in X. Let U be a regular open set in X such that  $A \subset U$ . Since every regular open set is  $\pi$ -open and since A is  $\pi gs$ -closed, that is,  $s-cl(A) \subset U$ . But we have  $\eta-cl(A) \subset s-cl(A) \subset U$ . Therefore  $\eta-cl(A) \subset U$ . Hence A is  $rg\eta$ -closed in X.

(11) Let A be a rgs-closed set in X. Let U be a regular open set in X such that  $A \subset U$ . Since A is rgs-closed, that is,  $s-cl(A) \subset U$ . But we have  $\eta-cl(A) \subset s-cl(A) \subset U$ . Therefore  $\eta-cl(A) \subset U$ . Hence A is  $rg\eta$ -closed in X.

(12) Let A be a  $\eta$ -closed set in X. Let U be a regular open set in X such that  $A \subset U$ . Since A is  $\eta$ -closed, that is,  $\eta-cl(A) = A$ ,  $\eta-cl(A) \subset U$ . But we have  $\eta-cl(A) \subset U$ . Therefore  $\eta-cl(A) \subset U$ . Hence A is  $rg\eta$ -closed in X.

(13) Let A be a  $g\eta$ -closed set in X. Let U be a regular open set in X such that  $A \subset U$ . Since every regular open set is open and since A is  $g\eta$ -closed, that is,  $\eta-cl(A) \subset U$ . But we have  $\eta-cl(A) \subset U$ . Therefore  $\eta-cl(A) \subset U$ . Hence A is  $rg\eta$ -closed in X.

(14) Let A be a  $\pi g\eta$ -closed set in X. Let U be a regular open set in X such that  $A \subset U$ . Since every regular open set is  $\pi$ -open and since A is  $\pi g\eta$ -closed, that is,  $\eta-cl(A) \subset U$ . But we have  $\eta-cl(A) \subset U$ . Therefore  $\eta-cl(A) \subset U$ . Hence A is  $rg\eta$ -closed in X.

**Remark 3.4:** From the above definitions, theorems and known results the relationship between  $rg\eta$ -closed sets and some other existing generalized closed sets are implemented in the following figure:

Where none of the implications is reversible as can be seen from the following examples:

**Example 3.5:** Let  $X = \{a, b, c, d\}$  and  $\mathfrak{S} = \{\phi, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}, \{a, b, d\}, X\}$ . Then  $A = \{a, b, c\}$  and  $B = \{a, b, d\}$  are  $\pi g$ -closed as well as  $\pi g\eta$ -closed sets.  $A$  and  $B$  are also  $rg\eta$ -closed sets but not closed.

**Example 3.6:** Let  $X = \{a, b, c, d\}$  and  $\mathfrak{S} = \{\phi, \{a\}, \{d\}, \{a, d\}, \{c, d\}, \{a, c, d\}, X\}$ . Then  $A = \{c\}$  is  $\pi g\alpha$ -closed as well as  $\pi g\eta$ -closed. It is also  $rg\eta$ -closed set. But it is neither closed nor  $g$ -closed. It is not  $\pi g$ -closed.

**Example 3.7:** Let  $X = \{a, b, c, d\}$  and  $\mathfrak{S} = \{\phi, \{c\}, \{d\}, \{c, d\}, \{b, c, d\}, X\}$ . Then  $A = \{b\}$  is  $g$ -closed,  $\alpha g$ -closed,  $g\eta$ -closed,  $\pi g\alpha$ -closed,  $\pi g\eta$ -closed. It is also  $rg\eta$ -closed set. But it is not closed.

**Example 3.8:** Let  $X = \{a, b, c, d\}$  and  $\mathfrak{S} = \{\phi, \{a\}, \{c\}, \{a, b\}, \{a, c\}, \{a, d\}, \{a, b, c\}, \{a, b, d\}, \{a, c, d\}, X\}$ . Then  $A = \{a, b\}$  is  $\pi g\alpha$ -closed as well as  $\pi g\eta$ -closed. It is also  $rg\eta$ -closed set. But it is neither closed nor  $\alpha g$ -closed set.

**Example 3.9:** Let  $X = \{a, b, c\}$  and  $\mathfrak{S} = \{\phi, \{a\}, \{c\}, \{a, c\}, X\}$ . Then  $A = \{c\}$  is  $\eta$ -closed as well as  $\pi g\eta$ -closed. It is also  $rg\eta$ -closed set. But it not  $\alpha$ -closed.

**Example 3.10:** Let  $X = \{a, b, c\}$  and  $\mathfrak{S} = \{\phi, \{a\}, \{b, c\}, X\}$ . Then  $A = \{a, b\}$  is  $g\eta$ -closed as well as  $\pi g\eta$ -closed. It is also  $rg\eta$ -closed set. But it is not closed.

**Example 3.11:** Let  $X = \{0, 1\}$  and  $\mathfrak{S} = \{\phi, \{0\}, X\}$ . The topological space  $(X, \mathfrak{S})$  is called the Sierpinski space. Then the set  $A = \{0\}$   $rg$ -closed as well as  $rg\eta$ -closed sets but not closed.

**Example 3.12.** Let  $X = \{a, b, c, d, e\}$  and  $\mathfrak{S} = \{\phi, \{a, b\}, \{c, d\}, \{a, b, c, d\}, X\}$ . Then

- 1)  $\eta$ -closed sets are  $\phi, \{e\}, \{a, b\}, \{c, d\}, \{a, b, e\}, \{c, d, e\}$   $X$ .
- 2)  $g\eta$ -closed sets are  $\phi, \{a\}, \{b\}, \{c\}, \{d\}, \{e\}, \{a, b\}, \{a, e\}, \{b, e\}, \{c, d\}, \{c, e\}, \{d, e\}, \{a, b, e\}, \{a, c, e\}, \{a, d, e\}, \{b, c, e\}, \{b, d, e\}, \{c, d, e\}, \{a, b, c, e\}, \{a, b, d, e\}, \{a, c, d, e\}, \{b, c, d, e\}, X$ .
- 3)  $\pi g\eta$ -closed sets are  $\phi, \{a\}, \{b\}, \{c\}, \{d\}, \{e\}, \{a, b\}, \{a, e\}, \{b, e\}, \{c, d\}, \{c, e\}, \{d, e\}, \{a, b, e\}, \{a, c, e\}, \{a, d, e\}, \{b, c, e\}, \{b, d, e\}, \{c, d, e\}, \{a, b, c, e\}, \{a, b, d, e\}, \{a, c, d, e\}, \{b, c, d, e\}, X$ .
- 4)  $rg\eta$ -closed sets are  $\phi, \{a\}, \{b\}, \{c\}, \{d\}, \{e\}, \{a, b\}, \{a, c\}, \{a, d\}, \{a, e\}, \{b, c\}, \{b, d\}, \{b, e\}, \{c, d\}, \{c, e\}, \{d, e\}, \{a, b, c\}, \{a, b, d\}, \{a, b, e\}, \{a, c, d\}, \{a, c, e\}, \{a, d, e\}, \{b, c, d\}, \{b, c, e\}, \{b, d, e\}, \{c, d, e\}, \{a, b, c, d\}, \{a, b, c, e\}, \{a, b, d, e\}, \{a, c, d, e\}, \{b, c, d, e\}, X$ .

#### 4. Characteristics of $rg\eta$ -Closed Sets

**Theorem 4.1:** If  $A$  is regular open and  $rg\eta$ -closed, then  $A$  is  $\eta$ -closed and hence clopen.

**Proof:** If  $A$  is regular open and  $\pi g\eta$ -closed, then  $\eta\text{-cl}(A) \subset A$ . This implies  $A$  is  $\eta$ -closed. Hence  $A$  is clopen, since every  $\eta$ -closed (regular) open set is (regular) closed.

**Theorem 4.2:** If  $A$  and  $B$  are  $rg\eta$ -closed sets in  $X$  then  $A \cup B$  is an  $rg\eta$ -closed set in  $X$ .

**Proof:** Let  $A$  and  $B$  be  $rg\eta$ -closed sets in  $X$  and  $U$  be any regular open set containing  $A$  and  $B$ . Therefore  $\eta\text{-cl}(A) \subset U$ ,  $\eta\text{-cl}(B) \subset U$ . Since  $A \subset U$ ,  $B \subset U$  then  $A \cup B \subset U$ . Hence  $\eta\text{-cl}(A \cup B) = \eta\text{-cl}(A) \cup \eta\text{-cl}(B) \subset U$ . Therefore  $A \cup B$  is  $rg\eta$ -closed set in  $X$ .

**Theorem 4.3:** A set  $A$  is  $rg\eta$ -closed set iff  $\eta\text{-cl}(A) - A$  contains no non-empty regular closed set.

**Proof: Necessity:** Let  $F$  be a regular closed set in  $X$  such that  $F \subset \eta\text{-cl}(A) - A$ . Then  $A \subset X - F$ . Since  $A$  is an  $rg\eta$ -closed set and  $X - F$  is regular open then  $\eta\text{-cl}(A) \subset X - F$ . (i.e  $F \subset X - \eta\text{-cl}(A)$ ). Then  $F \subset (X - \eta\text{-cl}(A)) \cap \eta\text{-cl}(A) - A$ . Therefore  $F = \phi$ .

**Sufficiency:** Let us assume that  $\eta\text{-cl}(A) - A$  contains no non empty regular closed set. Let  $A \subset U$  and  $U$  be regular-open. Suppose that  $\eta\text{-cl}(A)$  is not contained in  $U$ , then  $\eta\text{-cl}(A) \cap U^c$  is non empty regular closed set of  $\eta\text{-cl}(A) - A$  which is a contradiction. Therefore  $\eta\text{-cl}(A) \subset U$ . Hence  $A$  is an  $rg\eta$ -closed set.

**Theorem 4.4:** The intersection of any two subsets of  $rg\eta$ -closed sets in  $X$  is a  $rg\eta$ -closed set in  $X$ .

**Proof:** Let  $A$  and  $B$  be two subsets of a  $rg\eta$ -closed set. Assume  $A, B \subset U$ , where  $U$  is regular-open. Then  $\eta\text{-cl}(A) \subset U$ ,  $\eta\text{-cl}(B) \subset U$ . Therefore  $\eta\text{-cl}(A \cap B) \subset U$ . Since  $A$  and  $B$  are  $rg\eta$ -closed sets,  $A \cap B$  is a  $rg\eta$ -closed set.

**Theorem 4.5:** If  $A$  is an  $g\eta$ -closed set in  $X$  and  $A \subset B \subset \eta\text{-cl}(A)$ , then  $B$  is a  $rg\eta$ -closed set in  $X$ .

**Proof:** Since  $B \subset \eta\text{-cl}(A)$ , we have  $\eta\text{-cl}(B) \subset \eta\text{-cl}(A)$  then  $\eta\text{-cl}(B) - B \subset \eta\text{-cl}(A) - A$ . By **Theorem 3.2**,  $\eta\text{-cl}(A) - A$  contains no non empty regular closed set. Hence  $\eta\text{-cl}(B) - B$  contains no non empty regular closed set. Therefore  $B$  is a  $rg\eta$ -closed set in  $X$ .

**Theorem 4.6:** Let  $A \subset Y \subset X$  be a  $rg\eta$ -closed set in  $X$ . Then  $A$  is a  $rg\eta$ -closed set relative to  $Y$ .

**Proof:** Give that  $A \subset Y \subset X$  and  $A$  is a  $rg\eta$ -closed set in  $X$ . To prove that  $A$  is a  $rg\eta$ -closed set relative to  $Y$ , let us assume that  $A \subset Y \cap U$ , where  $U$  is regular open in  $X$ . Since  $A$  is an  $rg\eta$ -closed set,  $A \subset U$  implies  $\eta\text{-cl}(A) \subset U$ . It follows that  $Y \cap \eta\text{-cl}(A) \subset Y \cap U$ . That is  $A$  is a  $rg\eta$ -closed set relative to  $Y$ .

**Theorem 4.7:** If  $A$  is both regular open and  $rg\eta$ -closed set in  $X$  then  $A$  is a regular closed set.

**Proof:** Since  $A$  is a regular open and  $rg\eta$ -closed set in  $X$ ,  $\eta\text{-cl}(A) \subset U$ . But  $A \subset \eta\text{-cl}(A)$ . Therefore  $A = \eta\text{-cl}(A)$ . Therefore  $A$  is a regular closed set.

**Theorem 4.8:** For  $x \in X$ , the set  $X - \{x\}$  is  $rg\eta$ -closed or regular open.

**Proof:** Suppose that  $X - \{x\}$  is not regular open, then  $X$  is the only regular open set containing  $X - \{x\}$ . (i.e.  $\eta\text{-cl}(X - \{x\}) \subset X$ ). Then  $X - \{x\}$  is a  $rg\eta$ -closed set in  $X$ .

**Definition 4.9:** Let  $(X, \mathfrak{T})$  be a topological space,  $A \subset X$  and  $x \in X$ . Then  $x$  is said to be a  **$\eta$ -limit point** of  $A$  iff every  $\eta$ -open set containing  $x$  contains a point of  $A$  different from  $x$ , and the set of all  $\eta$ -limit points of  $A$  is said to be the  $\eta$ -derived set of  $A$  and is denoted by  $D_\eta(A)$ .

Usual derived set of  $A$  is denoted by  $D(A)$ .

**The proof of the following result is analogous to the well known ones.**

**Lemma 4.10:** Let  $(X, \mathfrak{T})$  be a topological space and  $A \subset X$ . Then  $\eta\text{-cl}(A) = A \cup D_\eta(A)$ .

**Theorem 4.11:** Let  $A$  and  $B$  be  $rg\eta$ -closed sets in  $(X, \mathfrak{T})$  such that  $D(A) \subset D_\eta(A)$  and  $D(B) \subset D_\eta(B)$ . Then  $A \cup B$  is  $rg\eta$ -closed.

**Proof:** For any set  $E \subset (X, \mathfrak{T})$ ,  $D_\eta(E) \subset D(E)$ . Therefore  $D_\eta(A) = D(A)$  and  $D_\eta(B) = D(B)$ . That is  $\text{cl}(A) = \eta\text{-cl}(A)$  and  $\text{cl}(B) = \eta\text{-cl}(B)$ .

Let  $A \cup B \subset U$  where  $U$  is regular open. Then  $A \subset U$  and  $B \subset U$ . Since  $A$  and  $B$   $rg\eta$ -closed  $\eta\text{-cl}(A) \subset U$  and  $\eta\text{-cl}(B) \subset U$ . Now,  $\text{cl}(A \cup B) = \text{cl}(A) \cup \text{cl}(B) = \eta\text{-cl}(A) \cup \eta\text{-cl}(B) \subset U$ . But  $\eta\text{-cl}(A \cup B) \subset \text{cl}(A \cup B)$ . So  $\eta\text{-cl}(A \cup B) \subset U$  and hence  $A \cup B$  is  $rg\eta$ -closed.

**Theorem 4.12:** If  $A$  is  $rg\eta$ -closed and  $B$  is any set  $A \subset B \subset \eta\text{-cl}(A)$ , then  $B$  is  $rg\eta$ -closed.

**Proof:** Let  $B \subset U$  where  $U$  is regular open. Then  $A \subset B$  implies  $A \subset U$ . Since  $A$  is  $\pi g\eta$ -closed,  $\eta\text{-cl}(A) \subset U$ .  $B \subset \eta\text{-cl}(A)$  implies  $\eta\text{-cl}(B) \subset \eta\text{-cl}(A)$ . Thus  $\eta\text{-cl}(B) \subset U$  and shows that  $B$  is  $rg\eta$ -closed.

## Regular Generalized $\eta$ -open Sets and Regular Generalized $\eta$ -Neighbourhoods

In this section new class of sets called regular generalized  $\eta$ -open (briefly  $rg\eta$ -open) sets and regular generalized  $\eta$ -neighbourhoods (briefly  $rg\eta$ -nhd) in topological spaces are introduced and we study some of their properties.

**Definition 5.1:** Let  $(X, \mathfrak{T})$  be a topological space. A subset  $A$  of  $X$  is called **regular generalized  $\eta$ -open** (briefly  **$rg\eta$ -open**) iff its complement is  $rg\eta$ -closed set. We denote the family of all  $rg\eta$ -open sets of a topological space by  **$rg\eta\text{-O}(X)$** .

**Theorem 5.2:** If  $A$  and  $B$  are  $rg\eta$ -open sets in a space  $X$ , then  $A \cup B$  is also a  $rg\eta$ -open set in  $X$ .

**Proof:** If  $A$  and  $B$  are  $rg\eta$ -open sets in a space  $X$ , then  $A^c$  and  $B^c$  are  $rg\eta$ -closed sets in  $X$ . By **Theorem 3.1**  $A^c \cup B^c$  is

a  $rg\eta$ -closed set in  $X$  (i.e.  $A^c \cup B^c = (A \cap B)^c$  is a  $rg\eta$ -closed set in  $X$ ). Therefore  $A \cup B$  is a  $rg\eta$ -open set in  $X$ .

**Remark 5.3:** The union of two  $rg\eta$ -open sets in  $X$  is generally not a  $rg\eta$ -open set in  $X$ .

**Example 5.4:** Let  $X = \{a, b, c\}$  with  $\mathfrak{T} = \{\phi, X, \{a\}, \{c\}, \{a, c\}, \{b, c\}\}$ . The set  $A = \{a\}$  and  $B = \{b\}$  are  $rg\eta$ -open sets but  $A \cup B = \{a, b\}$  is not a  $rg\eta$ -open set in  $X$ .

**Remark 5.5:** If  $A$  and  $B$  are  $rg\eta$ -open sets in  $X$ , then  $A \cap B$  is not a  $rg\eta$ -open set in  $X$ .

**Example 5.6:** Let  $X = \{a, b, c\}$  with  $\mathfrak{T} = \{\phi, X, \{a\}, \{c\}, \{a, c\}, \{b, c\}\}$ . The set  $A = \{a, c\}$  and  $B = \{b, c\}$  are  $rg\eta$ -open sets but  $A \cap B = \{c\}$  is not a  $rg\eta$ -open set in  $X$ .

**Theorem 5.7:** If  $\text{int}(B) \subset B \subset A$  and  $A$  is  $rg\eta$ -open set in  $X$ , then  $B$  is  $rg\eta$ -open in  $X$ .

**Proof:** Suppose that  $\text{int}(B) \subset B \subset A$  and  $A$  is  $rg\eta$ -open in  $X$  then  $A^c \subset B^c \subset A^c$ . Since  $A^c$  is a  $rg\eta$ -closed set in  $X$  by **Theorem 5.2**,  $B^c$  is a  $rg\eta$ -closed set in  $X$ .

**Definition 5.8:** Let  $x$  be a point in a topological space  $X$ . A subset  $N$  of  $X$  is said to be a  **$rg\eta$ -nhd** of  $x$  iff there exists a  $rg\eta$ -open set  $G$  such that  $x \in G \subset N$ .

**Definition 5.9:** A subset  $N$  of space  $X$  is called a  **$rg\eta$ -nhd** of  $A \subset X$  iff there exists a  $rg\eta$ -open set  $G$  such that  $A \subset G \subset N$ .

**Theorem 5.10:** Every nhd  $N$  of  $x \in X$  is a  $rg\eta$ -nhd of  $x$ .

**Proof:** Let  $N$  be a nhd point of  $x \in X$ . To prove that  $N$  is a  $rg\eta$ -nhd of  $x$ , by definition of nhd, there exists an open set  $G$  such that  $x \in G \subset N$ . Hence  $N$  is a  $rg\eta$ -nhd of  $x$ .

**Remark 5.11:** In general, a  $rg\eta$ -nhd of  $x \in X$  need not be a nhd of  $x \in X$  as seen from the following example.

**Example 5.12:** Let  $X = \{a, b, c\}$  with  $\mathfrak{T} = \{X, \phi, \{a\}, \{c\}, \{a, c\}, \{b, c\}\}$ . Then  $rg\eta\text{-O}(X) = \{X, \phi, \{a\}, \{b\}, \{c\}, \{a, c\}, \{b, c\}\}$ . The set  $\{a, c\}$  is  $rg\eta$ -nhd of point  $b$ , since the  $rg\eta$ -open set  $\{b\}$  is such that  $b \in \{b\} \subset \{a, b\}$ . However, the set  $\{a, b\}$  is not a nhd of the point  $b$ , since no open set  $G$  exists such that  $b \in G \subset \{a, c\}$ .

**Remark 5.13:** The  $rg\eta$ -nhd  $N$  of  $x \in X$  need not be a  $rg\eta$ -open in  $X$ .

**Example 5.14:** Let  $X = \{a, b, c\}$  with  $\mathfrak{T} = \{X, \phi, \{a\}, \{c\}, \{a, c\}, \{b, c\}\}$ . Then  $rg\eta\text{-O}(X) = \{X, \phi, \{a\}, \{b\}, \{c\}, \{a, c\}, \{b, c\}\}$ . The set  $\{c\}$  is a  $rg\eta$ -open set, but it is a  $rg\eta$ -nhd of  $\{c\}$ . Since  $\{c\}$  is a  $rg\eta$ -open set such that  $c \in \{c\} \subset \{b, c\}$ .

**Theorem 5.15:** If a subset  $N$  of a space  $X$  is  $rg\eta$ -open, then  $N$  is  $rg\eta$ -nhd of each of all its points.

**Proof:** Suppose  $N$  is  $rg\eta$ -open. Let  $x \in N$  be an arbitrary point. We claim that  $N$  is a  $rg\eta$ -nhd of  $x$ . Since  $N$  is a  $rg\eta$ -open set and  $x \in N \subset N$ , it follows that  $N$  is a  $rg\eta$ -nhd of all of its points.

**Remark 5.16:** In general, a  $rg\eta$ -nhd of  $x \in X$  need not be a nhd of  $x \in X$  as seen from the following example.

**Example 5.17:** Let  $X = \{a, b, c\}$  with  $\mathfrak{T} = \{X, \phi, \{a\}, \{c\}, \{a, c\}, \{b, c\}\}$ . Then  $rg\eta$ -O( $X$ ) =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{a, c\}, \{b, c\}\}$ . The set  $\{a, b\}$  is a  $rg\eta$ -nhd of  $b$ , since the  $rg\eta$ -open set  $\{b\}$  is such that  $b \in \{b\} \subset \{a, b\}$ . Also the set  $\{a, b\}$  is a  $rg\eta$ -nhd point of  $\{b\}$ , since the  $rg\eta$ -open set  $\{b\}$  is such that  $b \in \{b\} \subset \{a, b\}$ . (i.e.  $\{a, b\}$  is a  $rg\eta$ -nhd of each of its points). However the set  $\{a, b\}$  is not a  $rg\eta$ -open set in  $X$ .

**Theorem 5.18:** Let  $X$  be a topological space. If  $F$  is a  $rg\eta$ -closed subset of  $X$  and  $x \in F^c$  then there exists a  $rg\eta$ -nhd  $N$  of  $x$  such that  $N \cap F = \phi$ .

**Proof:** Let  $X$  be a  $rg\eta$ -closed subset of  $X$  and  $x \in F^c$ . Then  $F^c$  is a  $rg\eta$ -open set of  $X$ . So by **Theorem 5.15**  $F^c$  contains a  $rg\eta$ -nhd of each of its points. Hence there exists a  $rg\eta$ -nhd  $N$  of  $x$  such that  $N \cap F^c = \phi$ . (i.e  $N \cap F = \phi$ ).

## 5. Conclusion

The regular generalized  $\eta$ -closed set is defined and proved that the class forms a topology. The  $rg\eta$ -closed set can be used to derive a new decomposition of unity, closed map and open map, homeomorphism, closure and interior and new separation axioms. This idea can be extended to bitopological and fuzzy topological spaces.
