Abstract: The present investigation was undertaken to determine the chemical analysis of 4 Winter honey samples (CHN-MUL-RAJ, CHN-MUL-DON, CHN-MUL-BHA, CHN-MUL-CHI) collected from forest area of MulTahsil of Chandrapur District of Maharashtra State (India). These samples were analysed for several parameters such as moisture, total reducing sugar, Levulose or Fructose, Dextrose or Glucose, L/D ratio, Sucrose, Acidity. This type of chemical analysis favours the utilization of the honey for good quality in this area.

Keywords: Chemical Analysis, Winter Honey, Mul Tahsil

1. Introduction

Honey is a carbohydrate rich naturally complex product produced by honey bees from floral nectar. Honey has been used by all civilizations as nutrient food and in traditional medicine. The quality of honey depends on various physiological factors such as climate, soil, etc. Honey contains Sugar, Protein, Moisture, Vitamins, Minerals, Enzymes, Polyphenols and Flavonoids (Al – Manary et al., 2002) because of this unique complex nature, honey is proved to be useful in the treatment of burns, wounds, skin ulcers as an antioxidant and in the treatment of external eye diseases (Balasubramanyam, 2011). Furthermore, honey is a highly valuable ingredient in condiments, beverage, sauces and sweets. In fact numerous studies have been reported on physical, chemical and melissopalynological parameter of honeys from all over the world. (Adenkenet et al., 2010; Anklam, 1998; Cherian et al., 2011; Borkar Laxmikant and Mate Devendra, 2014; Downey et al., 2005; Ramnathnad Shivarann, 2012, Terrabet al., 2002; Xesus et al., 2010). The scientific literature revealed that the information is not available with respect to chemical characteristics of honeys from MulTahsil of Chandrapur District of Maharashtra State in India. The purpose of this study has to investigate some chemical parameters such as Moisture, Total Reducing Sugar, Levulose or Fructose, Dextrose or Glucose, Levulose/Dextrose, Sucrose, Acidity and Microscopical analysis of honey collected from different regions of MulTahsil of Chandrapur District of Maharashtra State in India.

2. Material and Methods

Chemical analysis of the honeys are carried out by using Indian Standard Specification, IS: 4941 (1974) and IS: 8464 (1977). The percentage of Total Reducing Sugar, (Levulose or Fructose + Dextrose or Glucose), Levulose, Dextrose, Sucrose, Acidity, Moisture and L/D ratio were estimated.

3. Results and Discussion

The chemical properties of the 4 Winter honey samples (Viz. CHN-MUL-RAJ, CHN-MUL-DON, CHN-MUL-BHA, CHN-MUL-CHI) form MulTahsil of Chandrapur District of Maharartshtra State are reported in table.

In the present study moisture content in the sample ranges from 24.8 – 31.2. Increase in temperature moisture is low and decrease the temperature moisture is high. Increase in moisture content of honey is also indicative of adulteration. The low moisture content of honey forms an important part of the system which protect honey from attack by microorganism.

Sugars:
- Honey consists of mostly Glucose and Fructose. The actual proportion of Fructose to Glucose in any particular honey, depends largely on the sources of the nectar. All samples
contained more Fructose than Glucose. This indicated that Mul honeys would be less prone to granulation Fructose level in honey is higher than that of Glucose. Honey with high Fructose to Glucose ratio would remain liquid for longer period. The Fructose/Glucose ratios may have an impact or honey flavour, since fructose is much sweeter than glucose.

**Acidity:**
Acidity of the honey sample ranges by 0.2829 to 0.2875 respectively. Acidity values may indicative the fermentation of honey sugar by yeast.
