Abstract: One side of the body is paralyzed with Pakshaghata, a neurological disorder also known as hemiplegia. It is brought on by damage to the brain cells that control motor performance. One of the primary causes of Pakshaghata, which happens when blood supply to a portion of the brain is restricted, is a cerebrovascular accident (CVA). In the current case study, a 43 - year - old male patient main complaints were weakness in the right side of his body and his inability to walk. He was determined to have had a hemorrhagic stroke and presented with right - sided hemiplegia as well as a persistent hemorrhage in the CT brain. Using natural herbs and therapies like Basti, an internal medicated enema therapy, ayurveda has helped treat neurological illnesses like Pakshaghata. The therapy tries to balance the Vata dosha, which regulates speech, movement, and sensory perception.

Keywords: Hemiplegia, Dakshin Pakshaghata, Panchakarma, Samshamana Aushadi

1. Introduction

Ayurveda The book "The Science of Life" strongly emphasizes prevention and promotes the upkeep of health by careful living, good thinking, a healthy diet, an active lifestyle, and the use of herbs. Having Ayahata Gati (unrestricted mobility) in its place, normal Vayu is in charge of a person's long lifespan of one hundred years free from illness. Translated, the term Pakshaghata means "paralysis of one half of the body, " where ”paksha” refers to either half of the body and “Aghata (=paralysis) ” refers to the impairment of the Karmendriyas, Gyanendriyas, and Manas.

Karmendriyas is seen as a component of the motor system, whereas Gyanendriyas are regarded as a component of the sensory system. Pakshaghata is a Nanatmaja - type Vatavyadhī. Mahavatavyadhī can appear as a result of either margaravana or dhatukshaya. Blood loss from Lohitakshamarma injury results in Pakshaghata. Pakshaghata also brought on by harm to Kakshadhararayam. Pakshaghata’s defining characteristics are Hasta PadaSamkocha, Ruja (pain), Vakstambha (slurred speech), and Chestahani (impaired motor activity). Some instances may also involve Sandhi Bandhavimoksha (joint weakness), Vaktravakratha (mouth deviation), and Sphoorana of Jihva (fasciculation of the tongue). In modern science, Pakshaghata is frequently linked to stroke symptoms and indicators. Major strokes may now be classified into three categories: These three types of stroke are ischemic, hemorrhagic, and lacunar. Atherothrombosis, or brain embolism, in the cerebral arteries, causes cerebral infarction of the ischemic form. When a cerebral aneurysm ruptures in young people, it can cause a hemorrhagic stroke. Lacunar strokes, caused by illnesses of small penetrating arteries, are deep, small cerebral infarcts seen in the basal ganglia, or deep white matter. Ayurvedic principles are often used in panchakarma therapy to treat patients with a variety of diseases. Translated, the term "panchakarma" refers to five treatments: Vamana (therapeutic emesis), Virechana (purgation), Asthapanaavasti (enema using medicinal decoction), Anuvasanavasti (enema using medicated oil), and Shirovirechana / Nasya. Along with these five primary procedures, several more supplementary treatments are available, such as Snehana (oleation), Swedana (fomentation), and others that are also Poorvakarmaor Panchakarma. Both neurological illnesses and paralysis can be effectively treated with panchakarma.

2. Case Study

A Male patient of age 43 yrs came for treatment at OPD in MMW brought by a relative with him in M. A. PODAR Ayurvedic Medical College, Worli, Mumbai with complaints

- 1) Weakness in Rt. Upper and lower limb
- 2) Unable to perform activities with Rt. Upper and lower limb
- 3) Unable to walk properly (since 4 months)
- 4) Slurred speech
- 5) Loss of appetite
- 6) Disturbed sleep
- 7) Constipation (Vibandha) (since 3 days)

PAST HISTORY –

Investigation -
CT Brain – (31/12/2021)
1. A large haemorrhage measuring 5.5*3.1*4.4cm is seen in the left ganglio - capsular region.
2. There is mid–perifocal edema noted. It is causing significant mass effects over the surrounding parenchyma.
3. There is resultant subfalcine herniation with a 9.1 mm rightward shift of the midline and effacement of the left lateral ventricle.
4. The haemorrhage is extending into the left lateral ventricle.

Diagnosis –
Based on clinical presentation and CT scan of the brain it was diagnosed as ‘Acute hemorrhagic’ (Hemiplegia right - sided) and Pakshaghat (Dakshina).

Sanmprapti Ghatak –
1. Dosha – Prana, udana and vyanavayu, Sadhak pitta, Tarpakkapha.

4. Discussion

The patient in this situation has symptoms like weakness in the right upper and lower limbs with restricted mobility, inability to stand or sit, etc., and the primary cause of these symptoms is vitiated vata dosha, which should be addressed first. Although the vatashamana and santarpana effects are present in all the medications being studied.

1) Snehana Abhyanga -
One of the Dinacharya, or traditional Indian Ayurvedic methods, is abhyanga. Treatment of many ailments, relaxation, and healing.7Snehana plays an important role in vatashamana and santarpana.

2) Nadi Sweda –
Swedana (sweating treatment) is typically administered following oleation - Snehana therapy. The process known as Swedana relieves Stambha, Gaurava, and Sheeta, which cause sweating. It performs a dual function in both Poorvakarma and Pradhanakarma.8

Nadi Sweda is notably helpful for Stambha / Sankochapradhanka Vata vyadhi, a disorder induced by vitiated Vata, according to research8

Mode of action -
Swedana has its main actions like Stambhaguna, Gauravaguna, Shitaghana, and Swedakarakatva.

3) BASTI -

a) Anuvasana Basti With Til Taila -
Anuvasana basti will keep the oil for a predetermined amount of time without having any bad effects if it is used with TilTaila. Acharya Charaka mentions Sneha’s digestion when discussing the Anuvasana Basti with the phrase "Sneham Pachati Pavakah, ” and after digestion, Dravyas can be used to affect the body.10

b) Erandamoola Niruha Basti -
It is mentioned in the Jangha, Urupada, and Prushta Shula hara. Eranda is the primary component and possesses Snigdha, Sukhsma, and Teekshna characteristics. As a result, it acts as Vataharana, Balya, and Vahanasthapana.

c) Baladi Yapan Basti –
Baladiyapanabasti explained by Acharya Charaka is used in the treatment of pakshaghata by its sadhyobalajana and rasayana qualities.

d) Jihwa Nirlekhana –
Jihwa Nirlekhana was done with Vacha Choorna and Yastimadhu Choornais very effective in managing speech disorders. The normalisation of Vata Dosha (Prakritavastha) contributes to the maintenance of the functioning of the mind, which promotes mental health and speech since Vata controls all mental activity.

e) Brihatvat Chintamani Ras -
Brihat Vata Chintamani Rasa is having the properties of medhya, Rasayana, lekhana, balya, kshayagna, ojovardhaka & yogavah which has a targeted effect for the management of Pakshaghata under Vataroga. The formulation also helps in protein scavenging, anti - inflammatory, and arrests neurodegenerative activity with the added benefit of crossing the blood - brain barrier.

f) CAP. Palsinuron -
It was given during the whole course of treatment. It is a proprietary medicine prepared by a combination of Ekangaveera Rasa, Mahavatavidhavamsa Rasa, Sameer Pannag Rasa, and Sutasekhara Rasa, and all these Yogas are directly indicated in Vataja Roga. Due to this specific type of combination, it was administered to patients to tackle symptoms like weakness and stiffness in the muscle.

g) Brahmi Vati -
Brahmi is one such widely used herbal drug that alleviates nervous function, enhances memory and reduces convulsions and inflammation.

Volume 12 Issue 7, July 2023
www.ijsr.net
Licensed Under Creative Commons Attribution CC BY
h) Gandharva Haritaki Churna -
It pacifies Vata Doshas, acts as Anulomaka, and Clears bowels.

i) Physiotherapy -
A therapeutic approach known as "physiotherapy" that emphasizes the science of movement assists patients in regaining, maintaining, and maximizing their physical function, strength, range of motion, and general well-being. Physiotherapy is used as part of the treatment to increase muscular flexibility and joint range of motion.

5. Conclusion

This case study shows how Ayurvedic medicine may successfully cure Pakshaghata. These were applied in this case, and the patient experienced fantastic outcomes. As an additional kind of treatment, physiotherapy helped to expand the limbs' restricted range of motion.

Later, the patient was able to walk by themselves. The outcomes were positive and good, which improved the patient's quality of life.

Based on this case study, it can be said that combining physiotherapy and panchakarma therapy to treat Pakshaghata was successful.
