

6. Conclusion

In this paper we have explained the concept of solving the problem while determining the optimal path for transformation. There are many researches done on finding optimal path but we have defined the problem related to the climatic condition (Snow Fall), so the problem of Snow Fall, Avalanche and Landslide can be pre-determined before choosing a path for transformation. We consider the Nearer Snow Body (NSB) from the route/path that is been selected as optimal path. And also the level of snowfall so we would get to know the chances of snow mountains. We have tried to accumulate most of the existing ideas on comparison of quadratic fuzzy numbers and proposed a new approach to imprecise number.
