Abstract: 2-amino-5-mercapto-1,3,4-thiadiazol was introduced in condensation reactions with both terephthaldehyde and 4-dimethylaminobenzaldehyde to yield imine derivatives 1a and 1b respectively. The resulting imine laws treated with amino acids L-valine and L-cysteine, also the imine 1b was reacted with amino acids L-cysteine, L-isoleucine and L-tyrosine to obtain five new imidazolidine derivatives 2a-erespectively. 2-amino-5-mercapto-1,3,4-thiadiazol was also converted to the corresponding azoaldehyde derivative 3 through coupling reaction of its diazonium salt with 4-hydroxybenzaldehyde dissolved in sodium hydroxide solution. The resulting azoaldehyde 3 was reacted with 2-amino-5-mercapto-1,3,4-thiadiazole to give the corresponding azoimine derivative 4. Treatment of the resulting azoimine 4 with amino acids glycine, L-valine and L-cysteine afforded three new imidazolidine derivatives 5a-crespectively.

1. Introduction

Thiadiazoles are clear to yellowish liquids which are soluble in alcohol, ether and slightly soluble in water; they are starting material for numerous chemical compounds including sulphur drugs (1). Thiadiazoles are easily metabolized by biochemical reactions and they are non-carcinogenic in nature (2). Thiadiazoles and their derivatives exhibit wide range of pharmacological activities such as antimicrobial activity (3), antidepressant, cardiotonic (4), antitubercular (6,7), anticonvulsant (8), antileishmanial, analgesic (9), antiinflammatory (10), anticancer (11), antimalarial (12) and effect on Tyrosinase enzyme (13). This diversity of biological activity may be due to the presence of -N=C=S moiety (14,15). There are four isomers of thiadiazole, among these four isomers 1,3,4-thiadiazole is the most thermally stable; which is only isomer doesn’t contain any sulphur- nitrogen bond (16). 1,3,4-thiadiazole relatively stable in aqueous acid solutions but the nucleus can undergo ring cleavage by aqueous base solutions (17).

Imidazolidines are compounds of highly conserved five-membered ring nitrogen-containing pharmacophores; and thus imidazolidines have attracted attention due to their important roles as building blocks in the synthesis of biologically active compounds (18). Imidazolidine derivatives possess some interesting biological activities such as antinflammatory, antiviral, antifungal, antihypertensive, antidiabetic, antigastroesophageal and antiasthmatic (19,20). Thus, in this article, we reported here the synthesis of 1,3,4-thiadiazole derivatives containing biologically active imidazolidine moiety, which might have some biological activity.

Melting points were determined on an Electro thermal Stuart SMP 30 capillary melting point apparatus. Infrared spectra were recorded on SHIMADZU FTIR-8400S Infrared Spectrophotometer as potassium bromide discs. 1H NMR spectra were collected on SHIMADZU FTIR-8400S Infrared Spectrophotometer as potassium bromide discs. 1H NMR spectra were collected on NMR spectrometer, Bruker 2009 spectrometer at 400 MHz in DMSO-d6, as solvent and TMS as an internal standard at Kashan University, Iran. Elemental Analysis (CHNS) was carried out with Perkin Elmer 300A Elemental Analyzer at Kashan University, Iran. Azoaldehyde derivative 4 was prepared following the method described by Acton (2).

3.1 Chemistry

The precursors imines 1a and 1b were synthesized by reacting the aromatic aldehydes (terephthaldehyde and 4-dimethylaminobenzaldehyde) with 2-amino-5-mercapto-1,3,4-thiadiazole in absolute ethanol as indicated in Scheme 1.
