Abstract: The control function plays a great role in the study reachable sets. In this paper, it was shown that reachable set \( \mathbb{R}^n(t) \) in a linear control system is closed, convex, bounded, symmetric and compact. This is true provided the associated control function has these properties.

Keywords: Reachable sets, Banach Space, Attainable Set, Weakly Compact, integrable function

1. Introduction

Let us consider the linear control system
\[
\dot{x} = A(t) x(t) + B(t) u(t), \quad x(0) = x_0, \quad t \geq 0 \tag{1.1}
\]
where \( \dot{x}(t) = \frac{d}{dt} x(t) \). \( x(t) \in \mathbb{R}^n \), the n-dimensional vector space. \( A(t) \) is an \( n \times n \) matrix function, \( B(t) \) is an \( n \times m \) matrix function whose elements are integrable on every finite interval. The function \( u \) is an \( m \)-vector-valued measurable function constrained to lie in a compact set \( \mathcal{U} \subseteq \mathbb{R}^m \). We note that under these conditions, \( \dot{x}(t) \) in (1.1) has a unique solution. [1]. Let \( X(t) \) be the fundamental matrix of the homogeneous equation
\[
\dot{X}(t) = A(t) X(t), \quad X(0) = I \tag{1.2}
\]
where \( I \) is identity matrix. We note that if \( A \) is a constant matrix \( X(t) = e^{At} \). For any measurable control function \( u(t) \in \mathcal{U} \), the solution of (1.1) is given uniquely, using variation of parameter method, by
\[
x(t) = X(t)x_0 + \int_0^t X^{-1}(s) B(s) u(s) \, ds \tag{1.3}
\]
where, as usual, \( x(0,u) = x_0 \). [1]

We start with the following notations and definitions.

1.1 Notation and Definitions.

1.1(a) Notations:
\( \mathcal{P} = \{ P \subset \mathbb{R}^n : P \text{ is closed} \} \).
\( g : [T_0, T] \to \mathcal{P} \), is called a target set function.
\( \mathcal{A}(t) = \{ x(t,u) : u \in \mathcal{U}, u \text{ is measurable} \} \).
\( \mathbb{R}^n(\mathcal{A}) = \{ x(t,u) : u \in \mathcal{U}, u \text{ is measurable} \} \).
\( \mathbb{R}^n(\mathcal{A}) = \bigcup_{t \geq 0} \mathbb{R}^n(\mathcal{A}) \).
\( \mathcal{U} = \{ u : [0, \infty) \to \mathbb{R}^m : u \text{ is measurable}, |u| \leq 1, j = 1,2,3, \ldots, n \} \).

1.1(b) Definitions. [1]

Definition 1. The set \( \mathcal{A}(t) = \{ x(t,u) : u \in \mathcal{U}, u \text{ is measurable} \} \) is called an attainable set.

Definition 2. The solution \( x(t,u) \) for which the initial condition \( x_0 : x(t,t_0,x_0,u) \in g(t) \forall t \geq 0 \) is called the core of the target.

Definition 3. A set \( U \) is symmetric about \( O \) if \( x(0,u) = x^{\ast} \).

Definition 4. [1] \( u \in \mathcal{U} \) is convex if whenever \( x,y \in \mathcal{U}, \) the line segment \( tx + (1-t)y \in \mathcal{U} \), where \( 0 \leq t \leq 1 \).

Definition 5. If \( P \) is a function defined on \( 0 \leq \nu \leq t \) and
\[
P(\nu) = \left\{ \begin{array}{ll}
u(\nu) : & \nu \in [0,s] \\
0 : & \nu \in [s,t]
\end{array} \right.
\]
then \( P \) is said to be admissible.

Definition 6. [3] A function \( f \) is said to be square integrable function if \( f \in L_2[0,t] \).

Definition 7. [5] \( \{ U_n \} = M \subset L_2 \) is said to be weakly convergent to \( u \) if
\[
\lim_{n \to \infty} \int_0^t f(x) U_n(x) \, ds = \int_0^t f(x) U(x) \, ds.
\]
for each \( f \in L_2 \).

1662
Definition 8. [5]
M is said to be weakly compact if every sequence of M has a weakly convergence subsequence with limit in M. Note that M is a Banach Space.

Definition 9: (Addition Formula of Reachable Sets)
Let \( \dot{x} = Ax + Bu \) be autonomous system; A, B constant. A is an \( n \times n \) matrix function and B(t) is \( n \times m \) matrix. If \( 0 \in U \), \( t \geq 0 \), \( s \geq 0 \), then
\[
\mathbb{R}(t) + e^{-at} \mathbb{R}(s) = \mathbb{R}(t + s)
\]

2. Propositions and Theorems

We have the following propositions and theorems concerning reachable sets for consideration. We are referring to the following linear control systems.

\[
\dot{x} = A(t) x(t) + B(t) u(t), \quad x(0) = x_0 \tag{2.1}
\]

Now, the controllability problem can be stated as follows: Find the conditions on A and B such that \( x(t, u) \) in (1.3) satisfies \( x(t, u) \in g(t) \). We note that the attainable set at a time \( t \), consists of all solutions of (1.1) which we obtain by using all values of admissible controls \( u \). We remark that hitting the target at time \( t \) i.e. \( x(t, u) \in g(t) \) is equivalent to \( (t) \cap g(t) \neq \varphi \). So, the controllable problem is now stated as follows: Is there an \( t \geq 0 \) for which \( \mathcal{A}(t) \cap g(t) \neq \varphi \)?

We also have the optimality problem, which can be stated as follows:

If \( t^* = \inf \{ t : g(t) \cap \mathcal{A}(t) \neq \varphi \} \) is there an admissible control \( u^* \) such that \( x(t^*, u^*) \in g(t^*) \)?

We consider the solution \( x(t, u^*) \) which is called the optimal trajectory. Finding optimal controls and their corresponding trajectories is called the time-optimal problem.

Now, let
\[
Y(t) = X^{-1}(t) B(t), \\
W(t) = X^{-1}(t) g(t) - x_0
\]
We note that \( \mathbb{R}(t) \) is called the reachable set of (1.1) at time \( t \). The optimal problem is equivalent to:
\[
\int_0^t Y(s) u^*(s) ds, \quad u \in W(t) \text{ in minimum time.}
\]

We also note that
\[
\mathcal{A}(t) = X(t) \{ x_0 + \mathbb{R}(t) \} = X(t) \{ x_0 + y : y \in \mathbb{R}(t) \}.
\]
We also note that \( g(t) \cap \mathcal{A}(t) \neq \varphi \) is equivalent to \( W(t) \cap \mathbb{R}(t) \neq \varphi \).

where \( W(t) \) is a defined in (2.2). We recall that \( \mathbb{R} = \{ \mathbb{R}(t) : t \geq 0 \} = \bigcup_{t \geq 0} \mathbb{R}(t) \).

Lemma 1. 
\( O \in \mathcal{A}(t) \) if \( f - x_0 \in \mathbb{R}(t) \).

Proof:
Let \( O \in \mathcal{A}(t) \)
\[
O = X(t) \{ x_0 + y \} \text{ for some } y \in \mathbb{R}(t).
\]
Since the matrix \( X(t) \) is non singular, then
\[
O = X(t) (x_0 + y) \Rightarrow X^{-1}(t) O = X^{-1}(t) X(t)(x_0 + y) \Rightarrow 0 = x_0 + y \Rightarrow y = -x_0 \in \mathbb{R}(t) \Rightarrow -x_0 \in \mathbb{R}(t).
\]

Conversely, suppose \(-x_0 \in \mathbb{R}(t)\). Then for some \( x(t, u) \in \mathcal{A}(t) \),
\[
x(t, u) = X(t) \{ x_0 + (-x_0) \} = X(t) 0 = 0.
\]

Since \( x(t, u) \in \mathcal{A}(t) \) and \( x(t, u) = 0 \). Then, clearly \( O \in \mathcal{A}(t) \), completing the proof.

Lemma 2. [4]
(a) If the control set \( U \) is convex, so is \( \mathbb{R}(t) \).

Proof: Let \( x, y \in \mathbb{R}(t) \), then
\[
x = \int_0^t Y(s) U_1(s) ds, \quad U_1 \in U.
\]
\[
y = \int_0^t Y(s) U_2(s) ds, \quad U_2 \in U.
\]
We are to show that
\[
\lambda x + (1 - \lambda) y \in \mathbb{R}(t), \quad 0 < \lambda < 1.
\]

Now,
\[
\lambda \int_0^t Y(U_1(s) ds) + (1 - \lambda) \int_0^t Y(U_2(s) ds = \int_0^t Y(s) \lambda U_1(s) + (1 - \lambda) U_2(s) ds,
\]
\( u \) is convex \( \Rightarrow \lambda U_1(s) + (1 - \lambda) U_2(s) \in U \).

Set \( v = \lambda U_1(s) + (1 - \lambda) U_2(s) \in U \),
\[
\lambda x + (1 - \lambda) y = \int_0^t Y(s) v(s) ds, \quad v \in U.
\]

\( \in \mathbb{R}(t) \text{ QED.} \)

(b) If \( 0 \in U \), then for all \( 0 \leq s \leq t \)
\[
0 \in \mathbb{R}(s) \leq \mathbb{R}(t).
\]

1663
Proof:
Since $0 \in U$
Recall $\mathbb{R}(t) = \{ \int_0^t V(s) u(s) ds; u \in U \}$.
So, $0 \in \mathbb{R}(s)$ [choose $u(s) \neq 0$ since $0 \in U$]
Let $x \in \mathbb{R}(s)$; then
\[ x = \int_0^1 e^{-\int_0^s A(s) ds} B(s) u(s) ds; u : [0, t] \to U \]
Since $x = \int_0^1 X^{-1}(s) B(s) u(s) ds$
and $X(s) = e^{s A}$ for $A$ constant
$Y(s) = X^{-1}(s) B(s) ds + \int_0^s X^{-1}(s) A(s) B(s) ds, 0 \leq s \leq t$
$x = \int_0^1 X^{-1}(s) B(s) P(s) ds \in \mathbb{R}(t)$.
where $P(s)$ is an defined in Definition 5.
So $x \in \mathbb{R}(s) \Rightarrow x \in \mathbb{R}(t)$. Thus
$\mathbb{R}(s) \subseteq \mathbb{R}(t), 0 \leq s \leq t$.
c) If $u$ is bonded, so is $\mathbb{R}(t)$.[4]
d) If $u$ is symmetric, so is $\mathbb{R}(t)$.[4]
The proof of (c) and (d) are hereby omitted.

**Proposition 1**
The unit ball in $L_2$ is weakly compact.
i.e.
$M = \{ f \in L_2: \| f \| \leq 1 \}$ is weakly compact.
$N = \{ f \in L_2: \| f \| \leq b < \infty \}$ is weakly compact.
Theorem 1.
If $U$ is convex and compact, then the reachable set $\mathbb{R}(t)$ is convex and compact.

**Proof of Theorem 1**
We have seen that if $u$ is convex and bounded, then so is $\mathbb{R}(t)$. We need only prove that $\mathbb{R}(t)$ is closed. Let $x_k$ be a sequence of points in $\mathbb{R}(t)$ such that $x_k \to x$ as $k \to \infty$.
We wish to show that $x \in \mathbb{R}(t)$.
\[ x_k \in \mathbb{R}(t) \Rightarrow x_k = \int_0^t V(s) u_k(s) ds \text{ for some } u_k \in U. \]
$U = \{ u : [0, t] \to E^m; |u_i| < 1, i = 1, 2, \ldots, m \}$
$U \subseteq L_2 \Rightarrow \| u \| \leq K$ for some $K$.
Thus $\mathbb{R}(t) \subseteq L_2$.
Hence, the sequence $\{ u_k \} \subseteq U$ has a subsequence $\{ u_{k_j} \}$
which converges weakly to a point $u$ in $U$.
Hence $\int_0^t V(s) u_k(s) ds \to \int_0^t V(s) u(s) ds$ as $k \to \infty$.
Therefore
\[ x = \int_0^t V(s) u(s) ds, \text{ some } u \in U \]
$\Rightarrow x \in \mathbb{R}(t)$
Hence $\mathbb{R}(t)$ is closed and so is compact.

**Theorem 2.**
The reachable set $\mathbb{R} : [0, \infty) \to E^n$ is continuous.

**Proof:**
We show that $\forall \varepsilon > 0 \exists \delta(\varepsilon) > 0$ such that
\[ \rho([t_1], \mathbb{R}(t_2)) < \varepsilon \text{ if } |t_1 - t_2| < \delta(\varepsilon). \]
For each $t_1 \geq 0, t_2 \geq 0$ if $x(t, u) \in \mathbb{R}(t)$, then
\[ x(t, u) = \int_0^t V(s) u(s) ds \]
$\| x(t_1, u) - x(t_2, u) \| = \| \int_0^{t_1} Y(s) u(s) ds \|.$
Since $\exists \lambda$ such that $\| u \| < \lambda, u \in U$ compact.
$\| x(t_1, u) - x(t_2, u) \| \leq \int_0^{t_1} \lambda \| Y(s) \| ds.$
Since an integral is an absolutely continuous function, it follows
that $\forall \varepsilon > 0 \exists \delta(\varepsilon) > 0$ such that if $|t_1 - t_2| < \delta(\varepsilon)$ then
\[ \rho([t_1], \mathbb{R}(t_2)) < \varepsilon. \] Thus $\mathbb{R}(t)$ is continuous.

**Theorem 3**
Let $A$ and $B$ be constant, ie $\dot{x} = Ax(t) + Bu(t), x = x_0$ (2.3)
Let $0 \in U$. If $0 \in \text{Int.} \mathbb{R}(s)$ for small $s$, then
1) $\mathbb{R}(t) \leq \text{Int.} \mathbb{R}(s)$ if $0 \leq t \leq s$.
2) $\mathbb{R}(t) = \{ t \geq 0 : \mathbb{R}(t) \text{ is open}. \}$

**Proof**
(i) Let $s > 0, \theta < s$. The additional formula for reachable sets states that
$\mathbb{R}(\theta) + e^{-A\theta} \mathbb{R}(s - \theta) = \mathbb{R}(s)$.
Let $\varepsilon > 0$ be small and is such that $0 \in \text{Int.} \mathbb{R}(\varepsilon)$ where $\varepsilon = s - \theta$.
Therefore there exists a ball $Q$ of small radius and such that
$Q \subseteq \mathbb{R}(\varepsilon)$.
If $t < \theta$, then $\mathbb{R}(t) < \mathbb{R}(\varepsilon)$. 

**Volume 6 Issue 10, October 2017**

Paper ID: ART20177470 DOI: 10.21275/ART20177470
Hence $\mathbb{R}(\theta) + e^{-\alpha T} \mathcal{Q} \subseteq \mathbb{R}(s)$. 

Since $e^{-\alpha T}$ is a homeomorphism, $e^{-\alpha T} \mathcal{Q}$ is a ball $P$ about 0.

So $\mathbb{R}(t) + P \subseteq \mathbb{R}(s)$.

Hence $\mathbb{R}(t) + P$ is a ball around $\mathbb{R}(t)$. Therefore, there is a ball $N$ around $\mathbb{R}(t)$ which is contained in $\mathbb{R}(s)$ so that $\mathbb{R}(t) \subseteq \text{Int} \mathbb{R}(s)$.

(ii) To prove that $\mathbb{R}$ is open.

$\mathbb{R}(t) = \bigcup_{t \geq 0} \mathbb{R}(t) \subseteq \bigcup_{s \geq 0} \text{Int} \mathbb{R}(s) \subseteq \bigcup_{s \geq 0} \mathbb{R}(s) = \mathbb{R}$

$\therefore \mathbb{R} = \bigcup_{s \geq 0} \text{Int} \mathbb{R}(s)$. The arbitrary union of open sets is open since interior $\mathbb{R}(s)$ is open. $\mathbb{R}$ is open.

3. Conclusion

We have given many roles played by reachable set $\mathbb{R}(t)$ on Linear control systems. So, the study of Linear control system cannot be said to be complete without the knowledge of reachable sets and their contributions to the systems. This set has so many roles on linear system which this contribution did not catch. We shall be happy if such roles will be investigated in near future.
