Abstract: Ayurveda is a science of life. Basic principles of Ayurveda are “swathasya swatha rakshananamurturya vikar prashahanam”. Swasthya i. e. well-being of individual dependent of prakruti which is been formed during garbhavastha (during gestation). Well-being of grabha can be achieved only through proper basic principles of garbhiniaparichrya(regimen) from conception of pregnancy till delivery. The foetus totally devoid of hunger and thirst, depends upon mother for nourishment. Before formation of placenta the nourishment of the embryo occurs through Upsneha (attracting moisture). During this time the embryo gets its nourishments through upsheha from the fluid moving all around it. But afterwards nourished by placental circulation. Ayurveda focus over dependency and nourishing structures in details. Here the comparative study is done regarding foetal nutrition providing structures.

Keywords: foetal nutrition, grabhaposhan, garbha, grabhiniaparicharya, Upsneha

1. Introduction

Embryology in Ayurveda described in terms of garbhasharir. Various concepts regarding garbhoipatti upto nishkraman (conception to expulsion) quoted by Acharyas along with applied views.

Acharyasushruta has explained garbhaadhan (fertilization), garbhaavkrami -masnamasikruddhi (fetal development), garbhaaposhan(nourishment), garbhadharanavdyhetc chapters in Ayurveda text. Acharya Charak has also explained masnamasikruddhi (monthwise development) according to Ayurveda. According to Ayurveda garbhaposhan is described in two stages. One is before formation of apara (placenta) and second after apara formation. Upsnehannyaya has described by Sushruta for the garbhaposhan and also different structures are described here. Upsnehan –Nutrition by process of diffusion of water of full lake nourishes the plants on the bank. Rasa is responsible for proper growth of the Garbha.

According to Ayurveda, essence offood (rasa) taken by mother is divided into three parts. First nourishes her body, the other promotes her breast milk and third nourishes the foetus. Modern science also mentioned that nutrition to foetus from mother occurs through two circulations namely–placental circulation and foetal circulation. Umbilical cord of foetus is attached rasa carrying nadi of mother which carries veerya of aahar rasa (nutritious parts) mother to the foetus by indirect nutrition (Upsneha) the foetus develops. So in this article we will study the structures involved in garbhaposhan and its correlation with the modern anatomical structures.

2. Discussion

Embryology is the study of development from the fertilized egg through eighth week. From fertilization through eighth week of development a stage called the embryonic period, the developing human is called an embryo. Further development i.e. beyond eighth week is considered as foetal development.

In Ayurveda related to Garbha, fertilization – foetal development – nutrition all these aspects explained in sharir-sahan of SushrutSambhita. Garbha related chapter explained by Acharyasushruta, Charaka, and Vagbhata in various treatises. The following Aadyhyayare described:

shukrashonishuddhishariradhyaya, Garbhabhavikriti, Grabhavakranti, Mhatrigrabhabhavanishthir (the foetus), apara, function of apara, grabhanabhinadi etc. these concepts of grabha are elaborated by Sushruta. Chapter of conception, care of product of conception and pregnant women, Month wise treatment of pregnant women, care of child just after delivery, instruction to pregnant women, cutting of umbilical cord are described by AcharyaCharaka thoroughly.

Ayurveda gives importance to the quality of seed (beesia i.e. sperm and ovum) and concept of conception is compared with planting of tree as for proper growth of tree which needs healthy nourishment. “Garbha is union of shukra shonitiAamadati” after the union of these garbha started the vrudhi that is the masnamasikruddhi which is from prathma mas to navam mas. In this duration of nine months, garbha require the essential nutrition that is as called the poshan.

In sharirsthana, AcharyaSushrutadescribed the poshan of garbha. According to Ayurveda Maternal food with nutrients enters in maternal rasvahinadaya through the nabhinadi of garbha. It circulates blood in garbasharir and sarvashariravayya. This nutrient part provide through Tiryak gat and Rasvahadhanannyaa to all over body of garbha causes Angpratyangposhan.

AcharyaCharaka has mentioned Matripasatrantra that is maternal food (nutritional part) absorbed by foetus and foetus get nourished by UpsnehannyaayaKedarkulyanyaya also explained in Ayurveda for the garbhaposhan. According to modern science nutrients, oxygen and
antibodies are provided to the foetus from the maternal circulation.

As per modern science, foetus is union of human egg and sperm that is called as the fertilization. This fertilized ovum get implanted in the endometrium with formation of germ layer of foetal development. In modern science two stages are described in foetal nourishment before placenta formation and after placenta formation. Embryogets nourished with uterine secretion and yolk sac. After placenta formation get nourished through the circulation from placenta to foetus – foetal circulation. Circulatory system of mother is not directly connected to that foetus, so the placenta function as the respiratory centre for the foetus as well as site of filtration for the plasma nutrients and waste through the umbilical cord which contain- Two umbilical arteries and one umbilical vein. Arteries are return de-oxygenated blood, foetal waste, CO₂ to placenta. Oxygenated blood and nutrients provide foetus by umbilical vein.

Circulation after birth changes occurs in-  
1) Pulmonary circulation – lungs functional and  
2) Systemic circulation – placenta removed

Three shunts present in foetal life ¹⁴
1) Ductusvenosus-connect the umbilical vein to the inferior vena cava  
2) Ductusarteriosus-connect the main pulmonary artery to theaorta  
3) Foramenovale - anatomical opening between the right and left atrium.

Development of healthy foetus and to prevent the nutritive anomalies of the foetus, Acharya mentioned Garbhnin Aharparichrya and also importance of GarbhninAharrasa in Ayurveda in terms of masanumasik ahar.¹⁵

If we compare the concept of grabhaposhan and foetal nourishment explained in Ayurveda and modern science, similarity related to dependency found. Foetus get nourished with maternal blood through placenta same as that of grabha acquires ‘Poshan’ through Matri- ahar – ras. Maternal heart is connected to foetus via channels. Here in Ayurveda channels are mentioned as Rasvahinidhamnya.

These above anatomical structures involved in foetal circulation Garbhaposhan according to Ayurveda.

3. Conclusion

Grabhaposhan is one of the important factors responsible for grabhaparivrudhii. Matruhrdaya, Nabhinadi, Rasvahini are the directly involved structures whereas Aparas indirectly mentioned in process of grabhposhan. Almost all structures found to be foetus this concept was elaborated with keen observation in Ayurveda save as that of modern science.
