Addiction Behavior of Young Places in Lubumbashi Rehabilitation Centers (Case Study Conducted in Lukuni, Bakanja / Center and Magone)

Kabatantshi Tujibikile Alain

Abstract: Our work focuses on the behavior of addiction of young people placed in rehabilitation centers of Lubumbashi. We found that many children in family breakdown (ERF) housed in rehabilitation centers recurrently resort to addictive behavior (delinquency, alcoholism, aggression, smoking, prostitution, vagrancy, crime, etc.) as if they still led the life of the street, while the said phenomenon can be repressed. That's why we made it a research topic. The results of our study will interest the State, the parents, the researchers, the young people, the educators of the rehabilitation centers and the society to the extent that everyone will have to realize that a child in family breakdown in a reeducation center does not is not abandoned but to whom it is necessary to bring a psychosocial help to measure, that is to say according to its difficulties of integration. In our work, we have provided a set of practical tips for anyone who has the opportunity to supervise the FRS to be able to fight this scourge. Addiction behaviors have already been the subject of many studies that we will not be able to examine exhaustively in this work. We have confined ourselves to examining some of the studies that best relate to us.

Keywords: Addiction behavior, rehabilitation

1. Introduction

Our work focuses on the behavior of addiction of young people placed in rehabilitation centers of Lubumbashi. We found that many children in family breakdown (ERF) housed in rehabilitation centers recurrently resort to addictive behavior (delinquency, alcoholism, aggression, smoking, prostitution, vagrancy, crime, etc.) as if they still led the life of the street, while the said phenomenon can be repressed.

That's why we made it a research topic.

The results of our study will interest the State, the parents, the researchers, the young people, the educators of the rehabilitation centers and the society to the extent that everyone will have to realize that a child in family breakdown in a reeducation center does not is not abandoned but to whom it is necessary to bring a psychosocial help to measure, that is to say according to its difficulties of integration.

In our work, we have provided a set of practical tips for anyone who has the opportunity to supervise the FRS to be able to fight this scourge.

Addiction behaviors have already been the subject of many studies that we will not be able to examine exhaustively in this work. We have confined ourselves to examining some of the studies that best relate to us.

Mukendi Mpinga H. (2014: 326), found that children in artisanal mines resort to inhaling alcoholic beverages and drugs that stimulate them to manifest addictive behaviors (working relentlessly and with stamina, braving bad weather, braving fear and shyness, overcoming sensitivity to scruples and the risk of accidents, etc.).

Faoro-Kreit B. (2011: 1), showed that the life of every child should be considered as an agora (space, crossroads of discussion) where different educational partners develop with the utmost seriousness the necessary provisions to put the young person sheltered from the structural and social changes of the third millennium.

Jean-Pierre Chartier (2010: 1), in his book entitled "Les transgressions adolescents", has identified an interesting metaphor in which he compares the earthquakes (geological movement of the earth) that make part of the earth shake (catastrophe) children who are at odds with family members who in turn shake up part of the social community, hence the term "time bomb."

Guéniat O. (2007: 123-129), in a survey conducted in Switzerland on "juvenile delinquency", found that the use of cannabis leads young people to crime, to present a deviant behavior that takes them away from social structures (integration difficulties, school dropout, professional failures).

KasongoMalobaTshikala (2010: 4), noted that the neglect of children, abuse, non-schooling, the death of a parent or both, divorce, remarriage ... push young people to submit to street life (drugs, theft, prostitution, etc.), and exposes them to psychic disturbances.

Tremblay M. (2007: 1), pointed out that several methods have been implemented to bring smokers to quit smoking in order to eradicate the morbidity and mortality related to the health problems caused by tobacco smoke. These are interventions aimed at promoting smoking cessation and the adequate treatment of tobacco dependence by health professionals.

The study conducted by the One-Unicef Group (2006: 72), carried out by the Observatory of Urban Change (OCU) on child labor in the mines and quarries of Katanga, revealed that the presence of alcoholic beverages and Psychotropic drugs in mines and quarries lead to drunken children and have harmful consequences on the body.
Pichot P. (1983: 264-273), emphasized that early experiences of children with parents in childhood are crucial for the development of the child's personality. If they have been good, they will facilitate the integration of good habits in it, vice versa.

The examination of the state of the question leads us to note that the studies on addiction behaviors have taken three directions: the studies relating to the etiology, those devoted to the harmful effects of the consumption of alcohol or drugs and finally, studies focused on the treatment of drug addicts.

Our study fits in the perspective of these different authors. For the latter, drugs and alcohol are sources of mental or physical suffering, leading to the production of antisocial acts. As for us, we proposed to describe the addiction behaviors as our predecessors but for a specific category of young people placed in rehabilitation centers of Lubumbashi.

Education is a phenomenon that accompanies the living being throughout life. That's why we say it starts from the cradle. When the child grows up in his family, he receives from his parents, from society and from his comrades a course of action that can not be neglected. However, under certain circumstances, some children move outside this natural circuit. That is, they engage in a harmful or unreasonable circuit with incalculable consequences both for themselves and for society itself.

At present, the production of delinquent acts in Africa is spectacular. Children and adolescents of all ages abandon their families or vice versa to start living freely in the streets of cities. This is explained by the fact that the Democratic Republic of Congo is more precisely Lubumbashi capital of the province of Upper Katanga remained on the fringes of the phenomenon of juvenile delinquency. In this struggle, several projects and development programs are initiated and committed to the cause.

Lubumbashi also did not stay on the sidelines of all delinquency-related practices. That is to say, of all the degrading behaviors of young people in family break today in wandering or interned. This is how we see as if the state, society and parents do not exist for this category of children.

Given the diversity of juvenile delinquency that developed in Lubumbashi, we were interested in the addictive behavior of young people in Lukuni, Bakanja / Center and Magone House.

Our main concern revolves around the following question: What are the addictive behaviors adopted by young people in Bakanja / Center, Magone and Lukuni? Which of these behaviors are common?

This is the question we will try to answer in this work.

In relation to the question posed in the problematic, we have formulated the following hypothesis: In answer to this question, the young people placed in the three centers of reeducation would adopt the following behaviors of addiction: the consumption of alcoholic beverages, drug and smoking. Among these most frequent behaviors would be the consumption of alcoholic beverages, valium and hemp.

As a goal pursued in this study, we identify the addictive behaviors adopted to show young people with family breakdown, parents and society ways and means to curb the expansion of this phenomenon is to extirpate the degree of delinquency so much.

To carry out our study, we used the descriptive method and the case study method. The data collection was done by three techniques: documentary technique, maintenance technique and observation technique.

Our study is divided into three parts:

- Theoretical framework;
- Methodological framework;
- Results.

2. Theoretical Framework

2.1. Some Concept

We defined the key concepts used in this study.

2.1.1 Addiction behavior

The expression addictive behavior contains two terms: behavior and addiction. We first defined the term "behavior" and then the term "addiction" and finally the expression "addictive behavior".

For H. Pieron, who reintroduced the word behavior in French psychological language in 1907, designates this concept as the set of phenomena observable externally. Behavior is an object of ordinary perception.

In other words, the term "behavior" means the set of actions and reactions (movements, physiological changes, verbal expression, etc.) of an individual in a given situation. (Https://fr.wikipedia.org> wiki>comport ...

Behavior is the manner of behaving or the set of objectively observable reactions of a living being.

In a 1990 article, psychiatrist Aviel Goodman considered the word addiction to be: "a process by which behavior, which can function both to produce pleasure and to relieve internal discomfort, is used in a mode characterized by repeated failure to control this behavior and the persistence of this behavior despite significant negative consequences." (www.ifa-addiction.fr>the.addictions-c ...

According to the Petit Larousse de la psychologie (2008: 90), addiction can be defined as a more or less alienating relationship of an individual to a substance (drugs, tobacco, alcohol, drugs), a practice (play, purchase) or a situation (romantic relationship, sect).
We talk about addiction, when the need outweighs the desire; when sensation replaces emotion and relationship; when a product or behavior invades the field of possible pleasures and becomes a priority and imperative to obtain pleasure or soothe a tension; when passion prevails over reason. In 2016, the term addiction is assimilated by society and addictology has become a medical and university specialty. (https://www.addictaide.fr>whatisit ...)

It should be said that we will use the concept of "addiction" to talk about the excessive consumption of alcoholic beverages and toxic products by an individual.

Thus, the expression "addictive behavior" refers to the behavior of young people, which consists in excessively consuming the toxic products and who have become dependent on them.

21.2. Young placed
According to the dictionary.reverso.net. English, the term "young" represents:

- Who is not advanced in age;
- Who belongs to the youth (in my young age).

In this work, the term "young" refers to children and adolescents aged 5 to 23 who are placed in rehabilitation centers. According to Xavier Nègre, quoted in Lexilogos (2002-2014), the word "placed" means placing someone under the authority, the dependence, the protection, and the orders of someone. On ourside, "placed" is synonymous with accommodation. Thus, the term "youth placed" is used to refer to boys aged 5 to 23 who, as a result of the family breakdown, were removed from the harmful influences of the street to be accommodated in a reeducation center.

2.1.3. Reeducation center
Lexilogos (2002-2014) argues that the concept "center" represents a public organization with a special purpose, generally socio-cultural, educational, and research.

It is also the place where people gather, an organization dedicated to a set of activities. (https://www.larousse.fr> French> center)

In this work a "center" is an establishment, a house that welcomes young people in family break.

It should be noted that several authors have defined the concept of "reeducation".

For Choisy (1950: 229), rehabilitation is considered as a special education for the social or family reintegration of a subject poorly adapted to society. We can therefore consider that "re-education" is a "catch-up or recovery education".

From the foregoing it follows that the expression "rehabilitation center" represents a home that houses young people with a family breakdown in order to give them an integral formation that could facilitate their social reintegration.

2.2 Theories of juvenile delinquency

Psychological and sociological theories form the backdrop of our study. Psychological theories describe how man is at one and the same time the product of the social milieu, the surrounding culture and a progressive construction of the self. We will take into consideration the psychological theories which stipulate that: "the anti-social behaviors (alcoholism, drug addiction, aggressiveness, prostitution, ...) can be learned by imitation or observation of a delinquency model presented by the adults and / or the relaxation of the system education (abuse, integration difficulties, lack of recognition, academic difficulties, professional failures, family conflicts, ...). That is to say that man is the product of his environment and it is the latter who forges his personality. Here are the authors who have highlighted these theories: the experience of A. Bandura (1977), cited by V. Bedin et al. (2011: 209-210), P. Daco (1973: 379-381), V. Bedin and J. F. Dortier (2011: 15), P. Karli (1987: 31).

Sociological theories emphasize the influence of the environment (culture, role, status, model, values-attitudes...) on the behavior of the individual. The great authors who have defended these theories are: C.R. Shaw et al., cited by J. P. Nkongolo Mukendi (1996: 18), T. Hobbes (1651), N. Elias (1973: 75) cited by V. Bedin (2011: 204).

3. Methodological Framework

We described the field of investigation, population, sample, research methods and techniques, and counting techniques.

3.1 Description of the field of investigation

Our field of research consists of three rehabilitation centers, namely: the ERF / Lukuni Rehabilitation Center, Bakanja / Center and the Magone House.

The first children's center Lukuni family break is located 25 km from the city of Lubumbashi. It is a State Center. Note that Bakanja / Center (located at number 47, Kapuasa Road, Q / Kafubu, C / Kampemba) and Magone (located at number 169 Munama road, Kafubu district, Kampemba commune) in Lubumbashi, they are part of Salesian works. All these three centers have the mission to rehabilitate children in family breakdown that constitute a time bomb or a public danger.
3.2 Description of the study population

Our target population is made up of 114 young alcoholics and drug addicts who have broken down and are interned in the three targeted rehabilitation structures. That is to say that the said population is composed only of young delinquent boys, whose number rose to 57 young people at the ERF / Lukuni center, 41 young people in Bakanja / center and 16 young people at the Magone handicraft center. Our target population is made up of 114 young alcoholics and drug addicts who have broken down and are interned in the three targeted rehabilitation structures.

That is to say that the said population is composed only of young delinquent boys, whose number rose to 57 young people at the ERF / Lukuni center, 41 young people in Bakanja / center and 16 young people at the Magone handicraft center. It should be noted that this study population is heterogeneous in terms of age, time spent on the street, time spent in the center and the environment. Their age varies between 6 and 23 years old. Their time spent in rehabilitation centers is between 1 year and more. Their time on the street is 1 year and up. Their environment (physical or social) exposes them to the consumption of addictive products either simultaneously alcohol or psychotropic, or in an isolated way that is to say a single addiction.

Note that in the three rehabilitation centers Lukuni, Bakanja / center and Magone, children break up family speak most of the country's languages, the most common are Kiswahili and French.

Finally, we opted to conduct our investigations on the young population of the city of Lubumbashi because they say: "the youth is the future in everyday life".

Here is the table showing the numbers of our target population:

<table>
<thead>
<tr>
<th>STRATA / CENTERS</th>
<th>Population (Ni)</th>
</tr>
</thead>
<tbody>
<tr>
<td>LUKUNI</td>
<td>57</td>
</tr>
<tr>
<td>BAKANJA/CENTER</td>
<td>41</td>
</tr>
<tr>
<td>MAGONE</td>
<td>16</td>
</tr>
<tr>
<td>TOTAL/N=</td>
<td>114</td>
</tr>
</tbody>
</table>

Legend:
Ni = Size of the stratum at the population level.
N = Total.

Considering the data contained in this table, out of 114 subjects that make up our study population: 57 cases come from the Lukuni Center, 41 subjects are hosted in Bakanja / center and 16 participants are placed in Magone.

3.3 Description of the sample

For this study, sampling is choosing a part to represent the whole. Thus, we opted to use weighted or proportional stratified random sampling "which consists in subdividing the population into subgroups called STRATES; extract within each stratum a group of individuals that will form the sample. (LubambaKibambeLangayi, 2006-2007)

Thus, according to LubambaKibambeLangayi (2017), weighted stratified random sampling is presented by the following formula:

\[ ni = n \times \frac{Ni}{N} \]

Legend:
\( ni \) = Size of the stratum at the sample level;
\( n \) = Total at the sample level;
\( Ni \) = Size of the stratum at the population level;
\( N \) = Total at the population level.

Taking into account the size of our target population, we have drawn a sample of the following: 13 ERFs in Lukuni, 9 young people in Bakanja / center and 4 young people to Magone. These are the 26 young people we put on, with whom we observed the presence of addiction behaviors and with whom we worked until the end. We selected them because they proved to be willing or faithful to our information gathering instrument throughout our research period in Lukuni, Bakanja / center and Magone centers; they presented a terrifying past; they were curious to know what we were doing ... It was all these reasons that led us to consider the 26 cases as relevant to our study. They are all male. Their age is between 14 and 23 years old. Their time on the street is 1 year and up. Their past in the rehabilitation centers varies between 1 to 9 years. Their environment encourages them to adopt addictive behaviors; they are all drinkers and drug addicts.

The sampling technique allowed us to circumscribe our study sample.

The table below shows the extraction of the subjects in our sample:

<table>
<thead>
<tr>
<th>No</th>
<th>Strates/Centers</th>
<th>Population (Ni)</th>
<th>Ponderation n/N</th>
<th>Sample (ni)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>LUKUNI</td>
<td>57</td>
<td>.22807018</td>
<td>13</td>
</tr>
<tr>
<td>2</td>
<td>BAKANJA/CENTER</td>
<td>41</td>
<td>.22807018</td>
<td>9</td>
</tr>
<tr>
<td>3</td>
<td>MAGONE</td>
<td>16</td>
<td>.22807018</td>
<td>4</td>
</tr>
<tr>
<td></td>
<td>Total</td>
<td>114</td>
<td></td>
<td>26</td>
</tr>
</tbody>
</table>

Referring to Table 2, 13 cases were extracted from the Lukuni stratum. While, 9 participants are from Bakanja / center. And finally, 4 subjects were taken from the Magone subgroup.

4. Results

Our methodological choice focuses on the study of cases, we propose to describe the behavior of addiction among young people placed in rehabilitation centers.

4.1 Presentation of cases and description of addiction behaviors

In this section of our work, we have for each case and according to the rehabilitation centers, presented the information collected by means of the interview and the observation on the behaviors of addiction.
Case No. 1: A. A. TO LUKUNI
1) Identification
Sex: Male * Age: 16 years * Time spent in the center: 6 years * Meeting place: ERF / LUKUNI Center * Training tracked: Agronomy.

2) His history
A.A. had been at Kasapa Center since 2009, at 11 years old. The divorce of her parents and the abuse of the stepmother (While her dad was at work, the stepmother made him suffer eg to draw water with a big can every time, to be able to eat it is only when his father was present, ...) are the main reasons that led him to flee the family home to seek refuge in the market. After a while, his father went to pick him up at the market, but he did not want to break away from street life; that is how he went to Bakanja / City, later to the town hall and from there to the Kasapa center. Currently, he wants to change and have a good life.

3) Description of the addictions used
- Types of addiction: whiskey and hemp.
- Source of funding: polish shoes and sell mentos gum in town.

4) Induced behaviors of addiction
a) Before use
The purchase of alcoholic beverages and psychotropic drugs is as follows: A.A.va will obtain the whiskey (Officer's, golden, goal) and hemp in the Nganda or the surrounding network; he buys in secret so as not to be seen by the framers of the center; but after buying he takes care of dispatching these products to close friends for reasons of confidence and security, that is to say he gives only to those who can not betray him to his supervisors.

Once after having bought the whiskey or hemp, it consumes it on the spot that is to say in the Nganda either it goes in bush for use. Every day, he buys 10 balls of hemp for 5 people, that is to say he and his 4 congeners. His expenditure in whiskey alcohol is 2 small bottles; he contributes with his friends something to realize 4800 FC in order to get intoxicated.

b) During use
After buying, they will take shelter each in his corner in the bush or in the field to get drunk. To consume the whiskey, each of them uses the bottle. As for the taking of hemp, he inhales it as one absorbs the cigarette; he takes drugs regularly (that is to say, he takes drugs every day: very early in the morning before the social workers come to the center and in the evening after finishing selling the mentos gum or waxing the shoes) introducing others to consumption to be like him, not to be ashamed or afraid when they work. This initiation is done by imposition given the position of strength or leader he occupies in the group vis-à-vis friends and also his advanced age compared to others. They think they find this strength in the minds that lead him to do this because he was also urged by friends to get hooked on the time he was still living in the market.

A.A was incapable of describing the spirits that lead him to behave in this funny way with himself and the congeners.

c) After use
In case AA, the consumption of alcohol whiskey and hemp pushes him to be under the influence of certain minds that he himself can not control, to drunk, to not think too much or not worrying about his life, not remembering his dead mother, completely ignoring his family, stirring up trouble or fighting, being stubborn to respond badly. The young person translates all this by the fact that the consumption of alcohol whiskey and hemp gives him the opportunity to live without hindrance.

Case No. 2: L. M. TO LUKUNI
1) Identification
* Sex: Male * Age: 17 years * Time spent in the center: 4 years * Meeting place: ERF / Lukuni Center * Training tracked: Agronomy.

2) His story
The case L. M. did not want to study, but he was still behind the wrestlers to imitate their exhibitions; his parents did not want their son to be in contact with people of bad reputation, something that L.M. did not approve of. That's how he decided to move away from his family, it was in 2011, to go live at Bukasa market MuenaDitu where he spent 3 months. Then, he was influenced by his counterparts of the same market who had in mind the idea or the plan to leave MuenaDitu to come to integrate the Kasapa center in Lubumbashi. To do this, they defrauded the train of the National Railway Company of Congo to reach the city of Lubumbashi. Their trip had lasted 1 month. Her ambition is to have the job or get married to have the kids.

3) Description of the addictions used
- Types of addiction: hemp, filtered tumbaco, whiskey (Officer's, horse, ...), alcohol five hundred or Kabondo.
- Source of funding: shoeshine in the city and resorts to the sale of field products as he does agronomy.

4) Induced behaviors of addiction
a) Before use
For our subject, its geographical position is an important factor that determines its behavior with regard to the purchase of alcoholic beverages and psychotropic drugs offered to it by the environment, ie its behavior is different depending on whether it is found in town or in the vicinity of the center of Lukuni. When he is in the center, he will buy alcoholic beverages and psychotropic drugs from the villages 25 and Kawama. On the other hand, when it is in town, it is the makeshift refreshments placed behind the buildings of the stores or in the market Mzee which it frequents when it wants to buy. The quantity purchased often depends on the amount of money possessed. Its daily consumption can reach 3 balls of hemp, or 3 small bottles of whiskey, or 2 coke bottles of five cents, or at least 9 stems of tumbaco.
b) During use
To get intoxicated, he does not expose himself but he hides in places where there is not a strong traffic (in the bush and in the bars of fortunes). He smokes hemp in the same way that cigarettes are made by mouth by placing the powder in a paper shaped like a rod. For alcoholic beverages, he uses the bottle.

c) After use
Our subject gets drunk, he eats a lot, he has the courage to work for money, he is not afraid or ashamed of people.

Case No. 3: C. L. TO LUKUNI
1) Identification
* Sex: Male * Age: 15 years * Time spent in the center: 3 years * Meeting place: ERF / Lukuni center * Training tracked: Agronomy.
As a wish, He wishes that the coordinator of the ERF / Lukuni center can provide them with the things of entertainment (screens, games, etc ...)
2) His story
He lived in Luena with his father who told him that his mother did not love him; she had thrown it; and after a while she was dead. Our subject was in constant conflict with his father because of the incomprehension he had decided to leave his father. To get to Lubumbashi, he had climbed above the wagons of the freight train. When he arrived in Lubumbashi, he was in the street where he met other street children. In 2012, he was picked up by his social agents to be sent to the city hall and from there to the ERF / Lukuni center.

3) Description of the addictions used
- Type’s addiction: Whiskey, Hemp and Tumbaco club.
- Source of funding: He finds money in the city by shining shoes and selling mentos gum, he does it in secret but the social framers know that the young family breaks up to go to town.

4) Induced behaviors of addiction
a) Before use
He buys alcohol, cigarettes and hemp anywhere, because there are many sellers by all. That is to say, in town as in both 25 villages and Kawama. Its daily consumption in alcohol and psychotropic is 3 bottles of small whiskey, 6 Tumbaco club stems and at least 2 balls of hemp. It is he who goes to these sources.

b) During use
He consumes these products outside the center (in the bush, in makeshift bowls or Nganda downtown, village 25 and Kawama village), but sometimes he gets drunk in the block while the others are out. He smokes hemp as he has always smoked tobacco. For the alcoholic beverage, it is used by the bottle, there is no initiation. The center is not aware of its alcoholism or drug addiction.

c) After use
Once drugged, C.L. has the courage to work well, steal the property of others and disturb public order.

Case No. 4: D. R. TO LUKUNI
1) Identification
* Sex: Male * Age: 17 * Time spent in the center: 3 years * Meeting place: ERF / Lukuni center * Training tracked: Agronomy.
2) His story
As a family, he was uncomfortable with the fact that he was always the victim of abuse from his father who told him to go and find another father elsewhere; something he did not digest. Like, he was getting by selling cookies, sweets, etc. He had decided to leave Kasai Oriental where he lived with his parents to take the SNCC train to Lubumbashi. Upon his arrival in Lubumbashi, he was housed in a Catholic parish in Bel Air district, but again nothing seemed to work. That is why he went to see the social workers who had facilitated his reception at the Lukuni Rehabilitation Center in 2012.

3) Descriptions of the addictions used
- Types of addiction: Patex glue, tumbaco club, hemp and whiskey.
- Source of funding: shoeshine in the downtown area.

4) Induced behaviors of addiction
a) Before use
He buys alcoholic beverages and psychotropic drugs from wherever he can find them in and around the Lukuni Rehabilitation Center. He was initiated by the friends of the center who told him to look like they were courageous because he was shy, concerned about his family and his future. As it is said that appetite comes with eating, it first began by absorbing two to three strokes of smoke from hemp or tobacco, using rod-shaped paper to smoke. He used the pen rod to inhale the pattex glue. Regarding alcohol whiskey he took a sip but now he consumes a lot. He buys at least 3 balls of hemp, 1 pack of Tumbaco club, 1 box of pattex glue that he inhales for a week and at least 3 bottles of whiskey.

b) During use
Consumption of alcoholic beverages and psychotropic drugs is a group of friends, it often happens in the bush every day after eating and when they go to play ball. They learned to consume alcoholic beverages or to smoke psychotropic drugs by means of seniors they had found in the center, currently dumped into the sanitation brigade or transferred to KaniamiKasese who taught them to be like them, by showing them how to hold a cigarette, how to smoke, how to differentiate hemp from other plants. Everything was done without the knowledge of the management staff. To date, he has become accustomed to taking drugs.

c) After use
Alcoholism and drug addiction drive D.R. to introduce girls from the center's neighborhood to the block or dormitory during the night, to play ball well, to influence others and to ignore the family's existence.
Case No. 5: L. K. IN LUKUNI
1) Identification
* Sex: Male * Age: 16 years * Time spent in the center: 3 years * Meeting place: ERF / Lukuni center * Training tracked: Agronomy.

2) His story
It was when he was in primary school that his mother died; his father did not take care of him, he was under the care of his grandmother who made him suffer. This is how he had fled to end up at the market Mzee Laurent Désiré Kabila. In 2012, the social workers went to the market and from there he was referred to the ERF / Lukuni Rehabilitation Center where he lives to this day.

3) Description of the addictions used
- Types of addiction: whiskey.
- Source of financing: Mentor's shop in town.

4) Induced behaviors of addiction
a) Before use
He gets the whiskey every time he sells the mentos in town, that is to say whenever he finds money, he buys easily. Usually, he gets 3 small bottles of whiskey, he operates alone.

b) During use
Consumption occurs outside the center (bush, Nganda or refreshment bar). People in the center do not know that he is drinking whiskey. He uses the bottle to drink.

c) After use
Under the influence of the drug L.K. has the strength to work, move around the city from one corner to another without getting tired, he does not have to be afraid of kidnapping police and street children who can steal his goods.

Case No. 6: F. A. TO LUKUNI
1) Identification
* Gender: Male * Age: 17 years * Time spent in the center: 5 years * Meeting place: ERF / Lukuni center * Training tracked: Agronomy.

2) His story
His father had given him a booth to manage but he had squandered money with his friends. When his father asked him for the account, he fled to find a place in the market. He then went to Bakanja / city and Lubumbashi commune to be finally recommended to the Lukuni Rehabilitation Center.

3) Description of the addictions used
- Types of addiction: hemp and whiskey.
- Sources of financing: polish the shoes and sell Mentos gum.

4) Induced behaviors of addiction
a) Before use
He buys toxic products either in town or in the two villages surrounding the center. That is to say, where he finds alcoholic beverages and hemp he buys without asking himself questions. Although he is placed in the Lukuni center, he is always supportive. He was introduced to the consumption of alcoholic beverages and drugs when he was at the market in order to cope with cold, fear, shame, carry luggage and sort onions. He consumes at least 2 balls of hemp and 3 bottles of whiskey a day.

b) During use
He inhales quietly in the bush and where he buys it. The material means used to absorb hemp is paper arranged in the shape of a rod and for alcohol it is the bottle that facilitates consumption.

c) After use
He presents the following behaviors: he becomes stubborn, provocative, liar because he is not afraid of anyone. He comes out of the center when he wants to go for a walk and look for girls in the neighboring villages.

Case No. 7: A. G. IN LUKUNI
1) Identification
* Sex: Male * Age: 16 years * Time spent in the center: 1 year * Meeting place: ERF / Lukuni center * Training tracked: Agronomy.

2) History
He comes from Dilolo where he spent several months at the market. He came from a polygamous family and his father had contracted several marriages, life had become very difficult in the family, he could not study. This state of affairs had pushed him to flee the family roof to end up in Lubumbashi. Through social workers, he was welcomed at the ERF / Lukuni center.

3) Description of the addictions used
- Types of addiction: Pattex glue, hemp, tambuco club and whiskey.
- Source of funding: shoeshine.

4) Induced behaviors of addiction
a) Before use
The operation is carried out near the street vendors, power supplies, and makeshift refreshments in the city and in the two neighboring villages in the Lukuni center. Its daily consumption is very varied, that is to say 3 balls of hemp or 9 rods of Tumbaco club or 1 box of Pattex glue or 4 bottles small whiskey.

b) During use
Sometimes, he puts the hemp powder in his shoes to get intoxicated but often it's by mouth. He consumes alcohol from the bottle. He does not initiate anyone else into alcoholism or drug addiction, but was forced by friends and cold when he was still living in the market. He drinks alone without the participation of a third person, and this, in the bush most often. That is to say, he can buy in town after finishing polishing shoes to consume next to the center. According to him, he smokes and drinks with calculation so as not to insult people and cause trouble.

c) After use
It is by being drunk that he has strength and a lot of appetite.
Case No. 8: H.S. IN LUKUNI

1) Identification
* Sex: Male * Age: 18 years * Time spent in the center: 6 years * Meeting place: ERF / Lukuni Center * Training tracked: Agronomy.

2) His story
Coming from a two-parent family, he was happy but the worst began with the death of his father. Her mother had remarried, and the new dad did not want him. Everything did not seem to go because the climate of misunderstanding was permanent between them. Due to ongoing conflicts with his foster father, he separated from his mother to be accepted first in Bakanja / City; then to the Kasapa Center and finally to the Lukuni Rehabilitation Center.

3) Description of the addictions used

5. Analysis of Results

After having presented the information collected on the 10
children in family breakdown placed in the rehabilitation
centers, we then analyzed the said information according
our study objective.

Our sole objective was to identify addiction behaviors
among young people placed in targeted rehabilitation
centers namely: Lukuni Center, Bakanja / Center and
Magone House.

Examination of the information collected shows the
juvenile behaviors of addiction and induced addiction
behaviors adopted by the ERFs, these are:
1) Juvenile addiction behaviors: Consumption of the drug
   (hemp, valium, pattex glue); Alcoholism and Smoking.
2) Induced Addiction Behaviors: Disturb the order in the
   center by doing such things as: stealing, lying,
   provoking, mistreating, chattering, stubbornness and bad
   response, ; ; ; Prostitution (introduce the girls to the
dormitory or go to the village); Verbal and physical
   aggression; Gourmandise for some and anorexia for others;
   Work tirelessly; Wandering: wandering aimlessly over long
   distances; Abnormal sleep for some and insomnia for others;
   Live in illusions (reveries); ; ; Do repetitive dizziness; Do
   the sport with endurance and performance; Brave fear or
   shame; Loss of memory; Feeling calm Ignorance of
   his biological family; Feeling of being strong and
   powerful; etc.

After having presented the information collected on the 26
children in family breakdown placed in the reeducation
centers, we will now analyze them according to the
objective of our study:

Our objective was to identify addiction behaviors among
young people placed in targeted rehabilitation centers
namely: Lukuni Center, Bakanja / Center and Magone
House.

Examination of the information collected shows the
juvenile behaviors of addiction and induced addiction
behaviors adopted by the ERFs, these are:
1) Consumption of the drug (hemp, valium, pattex glue);
2) Alcohol;
3) Smoking;
4) Disturb the order in the center by doing such things as
   stealing, lying, provoking, mistreating, chattering,
   stubbornness, etc.
5) Prostitution (introduce the girls in the dormitory or go
to the village);
6) Verbal and physical aggression;
7) Gluttony for some and anorexia for others;
8) Work tirelessly;
9) Brave the bad weather;
10) Wandering: wandering aimlessly over long distances;
11) Abnormal sleep for some and insomnia for others;
12) Living in illusions (reveries);
13) Injuries and provocations;
14) Feeling calm;
15) Repetitive dizziness;
16) Sports with endurance and performance;
17) Brave fear or shame;
18) Loss of memory;
19) Chanceler;
20) Ignorance of his biological family;
21) Feeling of being strong and powerful;
22) Feeling of sweating a lot;
23) Immobilism; etc.

It emerges from this analysis of the results that the
juvenile behaviors of addiction adopted by our subjects
are varied. However, the most common in the three
centers are: alcoholism, drug use and smoking.

Here is the table that lists the frequency of juvenile
addiction behaviors adopted by the ERFs and induced
behavior of addiction in the three rehabilitation centers.

</table>
The data contained in the table above, show the frequencies of juvenile addiction behaviors and the behaviors induced by addiction among a range that was enumerated during our interviews with the 26 targeted cases in the field found 52 frequencies of the highest responses of juvenile addiction behaviors that share as follows: 21 responses pinned alcoholism, 21 statements determined drug use and 10 reactions cited smoking. In contrast to the juvenile addiction behaviors adopted by ERFs, we also recorded 80 responses as frequency of addiction-induced behaviors that are distributed around: 10 reactions cited disturbing the order in the center and out of the center, 10 responses reveal working tirelessly, 10 statements indicate braving fear and shame, 8 responses pinning abnormal sleep for some and insomnia for others, 6 reactions speak of feeling calm, 6 answers reveal repeated dizziness, 5 reactions show ignorance of the biological family, 4 statements say vagrancy, 3 opinions pinpoint prostitution, 3 opinions affirm verbal and physical aggression, 3 reviews show to do the sport with stamina, 3 opinions speak sensation of being strong and powerful, 2 answers say sweat a lot, 2 attitudes evoke anorexia, 1 answer indicates live d in the illusions, a reaction shows brave the bad weather.

Mapping of the most common juvenile addiction behaviors in the three targeted rehabilitation centers.
Psychotropic products inhaled by children in family breakdown placed in the three reeducation centers of Lubumbashi (Lukuni, Bakanja / center and Magone)

**Figure 2:** Main psychotropic drugs consumed by ERFs
By way of illustration, we have observed the following behaviors induced by the addiction following the consumption of alcohol and psychotropic drugs in young family members placed in the three rehabilitation centers:

1) AA, LM, CL, DR, FA, AG, HS, JJ, AK, XX, TU, NN, GF, AP, AQ, AS, MV, MD, PY and AZ have inhaled the hemp that brought them to adopt the following behaviors: to ignore the existence of one's biological family, to disturb the public order (to steal the property of others), verbal and physical aggression, to brave fear or shame, to work tirelessly, greediness (to grow), prostitution (introducing girls in the dormitory), playing with stamina and ballooning performance, vagrancy, feeling strong and powerful, abnormal sleep (sleeping a lot and deeply), anorexia, loss of balance and vertigo at repetition, immobility, loss of bad memories, silent, insomnia, living in illusions (reveries), feeling of sweating a lot, stable, chatter, stubbornness, lies, fights and provocations;

2) The cases DR and AG inhaled the glue pattex, here is their behavior induced addiction: prostitution (introducing girls in the dormitory or go to the village), verbal and physical aggression, play with endurance and ballooning performance, greed, work tirelessly, ignore the existence of one's biological family;

3) Cases XX, NN and AQ inhaled the valium that led them to manifest the following behaviors: loss of balance, insomnia, anorexia (loss of appetite), attraction to sex (prostitution), work tirelessly, aggression, disturb the established order;

4) LM, CL, DR, AG, HS, IZ, XX, AQ, MV and MD smoked tobacco, and presented the following behaviors: braving fear and shame, working tirelessly, greed, disturbing public order (stealing other people's property), prostitution (bringing girls into the dormitory), playing with stamina and ballooning performance, ignoring the existence of their biological family, vagrancy, working tirelessly, feeling of be strong and powerful, brave bad weather (cold), abnormal sleep, anorexia, loss of balance (repeated vertigo or headaches), immobility of body and mind, fatigue, insomnia, fights;

5) AA, LM, CL, DR, LK, FA, AG, HS, IZ, JJ, AK, TU, AP, UR, AS, AT, QS, OI, MD and AZ have consumed the whiskey that led them to: live in illusions (daydreams), ignore his biological family, disturb the established order (aggressiveness, fight, stubbornness, steal the goods of others, dominate others, revenge, provocations, chatter, lie), brave the fear or shame (in the face of kidnapping police and street children who can steal it), work tirelessly, greed, play with stamina and ballooning, prostitution (bringing girls into the dormitory), wandering, abnormal sleep, brave bad
weather, sweating a lot, gossip, immobility, insomnia, headaches (loss of balance, repeated dizziness), anorexia, feeling of being strong and powerful, insomnia, increasing weight (getting fat);

6) The cases LM, IZ and JJ took the five hundred or Lutuku, and produced the following induced behaviors of addiction: brave fear or shame, work tirelessly, gluttony, abnormal sleep, brave the weather, aggression;

7) The HS, TU, AQ, UR, AS and QS cases drank Simba beer which led them to the following indiut behaviors: wandering (wandering aimlessly over long distances), braving fear or shame, disturbing public order (fights, provocations), ignoring one's biological family, playing with stamina and balloon performance, sweating a lot, anorexia, feeling strong and serious;

This allows us to partially confirm our first hypothesis, stipulating that the addiction behaviors adopted by the young people of the three reeducation centers would be the consumption of alcoholic beverages, drugs and smoking.

The most common behaviors are the consumption of alcoholic beverages, valium and hemp. To these behaviors are added the behavior induced addiction (see table n° 3).

We can say that the young family breakers who are in Lukuni compared to those in Bakanja / center and Magone have some addictive behaviors that differentiate them. In the sense that, they present the behaviors induced of specific addiction namely: prostitution, verbal and physical aggressiveness, brave the bad weather, live in the illusions. They do not consume Simba beer. On the other hand, those of Bakanja / center and Magone have the feeling of being calm, they do not use the glue pattex and the alcohol five cents to take drugs.

Juvenile behaviors of addiction vary according to the types of products inhaled by the young family break (Hemp, Colle pattex, Valium and Tobacco) and according to the types of alcoholic beverages consumed (whiskey and beer Simba).

We can say that the young family breakers who are in Lukuni compared to those in Bakanja / center and Magone have some addictive behaviors that differentiate them. In the sense that, they present the behaviors induced of specific addiction namely: prostitution, to live in the illusions. They do not consume Simba beer. On the other hand, those of Bakanja / center and Magone have the sensation of being calm, they do not use the glue pattex to take drugs.

It should be noted that the sources of financing to which Lukuni, Bakanja / center and Magone families are reluctant to obtain alcohol and psychotropic drugs are diverse, namely: Selling agricultural products grown in the center (potatoes, tomatoes) onion, corn, vegetables, etc.; Sell the Mentos Gum in downtown avenues; Circulate in town to practice shoe shine; Stand in front of shops and other administrative buildings to provide service especially where there is a heavy flow of people and vehicles to regulate traffic at these buildings, to keep or wash vehicles for the purpose of paid; Prester in workshops as an artist, carpenter, mechanic, shoemaker, etc.; Carry parcels on behalf of the private sector for a premium of encouragement; Receive at the end of each month something as money from the pockets of the sponsors.

We can say that the young family breaks of three rehabilitation centers: Lukuni, Bakanja / Center and Magone engage in some lucrative activities that facilitate them to get something to buy alcohol, tobacco, hemp, valium and Pattex glue without framing.

Our study has shown that the most common addictive behaviors among young family members placed in rehabilitation centers are:

- Alcoholism;
- Consumption of the drug;
- Smoking.

This finding confirms the results of previous studies by: H. Mukendi Mpinga (2014: 326), F-K. B. Faoro-Kreit (2011: 1), Jean-Pierre Chartier (2011: 1), KasongoMalobaTshikala (2010: 4), Mr. Tremblay (2007: 1), O. Gueniat (2007: 123-129), Study conducted by the one-unicef group (2006: 72), P. Pichot (1983: 264-273). We attribute this similarity of results to the fact that when young people from broken homes are dissatisfied or feel insecure and whatever their areas of origin adopt various addictive behaviors that disturb their personality and away educational structures, social, professional, etc. That is to say that alcoholism, drug consumption and smoking have harmful effects on the behavior of ERFs placed in rehabilitation centers and also for those living in wandering.

It should be noted that in our study, consumption of alcoholic and psychotropic beverages is closely related to adverse socio-economic and psychological conditions (parental misunderstanding or marital conflict, abuse, divorce, death of a parent or all two, disgust of studies, fugue, large family, misery, unemployment, witchcraft, theft, etc.).

6. Suggestions and Recommendations

Referring to the results obtained, we suggest that leaders and supervisors of rehabilitation centers, parents, the state and the community fight against alcoholism and drug addiction of young people, by: regulating the production, trade and consumption of psychotropic drugs, improving the family climate, censoring the products offered by advertising and the mass media, raising awareness and persuading the FRTs to adopt a reserved or cautious attitude towards alcoholic and psychotropic drinks; to be the first to help children overcome the difficulties of life, something that many adults do not do; ban all forms of injustice, abruptness, misunderstanding, abuse, denigration, divorce between parents; sensitize and persuade young people to join the choir, group of readers or theater; monitor suspicious ERFs that they can not introduce and initiate others to take alcoholic and
psychotropic beverages within the center; hire psychologists, pedagogues, social workers, ... in sufficient numbers in the rehabilitation centers to support or help the ERF to raise awareness; help young people avoid experiencing street life; to help the ERF to have a high morale towards alcoholic and psychotropic drinks; avoid accusing the ERFs of all the ills of society; to show love and compassion to the ERF.

It is the responsibility of the public authorities and those responsible for re-education centers for young people with a family breakdown to ensure that the legal provisions on alcoholism, smoking and drug use are complied with in order to play their role well. Guarantor

7. Conclusion

At the end of this study, which focused on addiction behaviors among young people placed in the rehabilitation centers of Lubumbashi (ERF / Lukuni, Bakanja / Center and Magone). The goal was to identify the addiction behaviors adopted by the young family breakers placed in the three rehab centers.

To achieve this goal, we used the descriptive method and the case study, which were made operational through the use of documentary techniques, observation and maintenance.

The sample included 26 relevant cases extracted from the weighted random stratified sampling technique, which we thoroughly investigated.

After analyzing and interpreting the results, we came to the following findings:

1) To cope with the suffering, the young family break-up of Lukuni, Bakanja / Center and Magone adopt an alcoholic behavior or drug addict. We emphasized this because most of these young people spent part of their lives on the street with friends where they became loyal to alcoholic beverages and psychotropic drugs; for this reason we have proposed that ERFs can be accompanied psychologically in order to have a morale of steel vis-à-vis alcoholic drinks and psychotropic, since the decision to stop intoxication is theirs.

2) The most popular addiction behaviors are: Alcoholism, Drug use and Smoking, plus addictive behaviors. However, we also found that Lukuni's ERFs are more in demand than the other two re-education structures, as it is a newly created center by the state that does not yet have a solid foundation for dealing with untimely exits of the ERF to the surrounding villages or to the city center of Lubumbashi.
