

# Are We the “Small” or the “Big”?

Berov G. Lyubomir

**Abstract:** *So where are we on the scale between the “small” and the “big”? Who knows... And what if we are both?.*

**Keywords:** Cells, Energy, Intellect, Elementary Particles, Communication

Dear reader, what do you **think, where is the human being** on the scale between the “small” and the “big”? I would argue that it depends on the viewpoint but before looking for the answer, let’s begin with the creation of our material world. However, dear reader, please keep in mind that my hypothesis is based solely on my deeply unscientific, basic and hypothetical concepts.

In my article, “The birth of the “sons and daughters” of the intelligence of the dark energy”, I introduce the idea that the all-powerful old (a.k.a. mature) intellect of the dark energy singlehandedly creates our material world. In this process, the old intellect also plants the seed of the new intellect that will eventually displace the old. Remember the ancient legend of the serpent, biting its tail? In my hypothesis, this process is possible because the elementary particles, in addition to all of their scientifically proven qualities, are also endowed “unscientifically” with some form of intellect.

By the way, I think that the modern science, simply by not allowing for the intellectual properties of the elementary particles, has brought on itself many of the big problems it faces today. My articles are a humble attempt to help, at least a bit, in this situation.

So let’s go back to the question we asked at the beginning.

Now, if each elementary particle features a form of intellect, each material creation also has some form of intellect. And what about the human being? Let’s look at the facts: the human body consists of about 11 trillion living cells, highly specialized and separated in groups, tissues, organs, and so on. The modern science studies a number of ways that the cells in the human body communicate with each other but none of those is based on the cell intellect. Further, the modern science explains the energy state of the cell only with the consumption of food. However, the science has no explanation as to what makes it possible for the cell to have more (in some cases much more) energy than the measurable calories in the food we eat. I’m convinced that this is a serious scientific flaw. Why? Because I think that the cell intellect has the ability to absorb the so-called free, cosmic energy (a.k.a. the intelligent energy of the dark matter).

I also believe that the level of intellectual communication between the cells in the body is actually very high because the outcome from a human viewpoint is incredible. Once established, the individual human being functions as such in most cases with an extremely high safety margin. The

scientifically proven types of cell communication in the human body are unable to explain this fact. So let’s accept the intelligence of both the human being, and of each living cell.

Now let’s get back to the “point of view” argument in our “small” vs. “big” question.

Dear reader, have you ever asked yourself: What is the individual cell “thinking” about the material entity (human being) that it is part of? Perhaps it is “worshiping” it in its own way? I think each of our cells has its own joys and worries, its dreams, its illnesses and healing processes. Also, each cell clearly feels the support or alienation of the human being to which it belongs. What I just described is the intellectual communication between the “small” (the cells) and the big (the whole body). As such, my theory allows us to see the same thing we have been looking for ever since we had recognized our intelligence, but from the viewpoint of the “small”.

Now, dear reader, let’s take this one step further: what if, the same way each of our cells feels a “small” part of a “big” human beings, each human being can be a small cell in a much bigger creation? It feels very familiar, doesn’t it? So what is “small” and what is “big”. I think this is not an important questions. It is much more important to know, and remember that, depending on the point of view, we can be both the “big” and the “small” – both equally important states for us.

This last conclusion is why I wrote this article. I have little hope that one of the great rulers of our world would read it and, even less so, would consider that he or she may be the “small”, but who knows...

Dear reader, it is worth thinking about these questions isn’t it?
