

# Signposts along the Road

Berov G. Lyubomir

Engineer, Independent Innovative Ideas Researcher, Smolyan 4000, Bulgaria

**Abstract:** *How does the intellect of our modern human civilization develop? While the answer remains a mystery to the modern science, I believe there are a number of critical artefacts - the "signposts" along the road, which hold the key.*

**Keywords:** Artifacts, Intellect, Pyramids

Dear Reader,

What did you think - can an article be written about the signposts along the road when we talk about the evolution of the human intellect? Well, we can at least try. Daily, as we run into multiple cross roads, we also run into various signs, that guide us in the right direction, don't we? And this is exactly how the intellect of our modern human civilization develops. And the signposts along the its road are the artifacts that I review and interpret.

Let's start with the Egyptian pyramids, and in particular with the Pyramid of Heops. This magnificent engineering masterpiece is built out of 2,300,000 stone blocks, each weighing from 2 to 50 tons. The exterior lining consists of about 140,000 formwork blocks, each 2.5 meters thick, weighing 15 tons and polished to within 0.2mm. Incredible! According to some Egyptologists such as Mark Lenar, the Heops pyramid was built for about 20 years and completed around 2580 BC. However, multiple pieces of evidence exist that completely reject this theory and point to a much earlier year of completion.

But the key question is not when but why was the Pyramid built? According to the history of ancient Egypt, the Pyramid was supposed to be the tomb of pharaohs. However, pharaoh mummies were never found in the Pyramid of Heops. Modern Egyptologists offer many explanations for this. However, they fail to mention the most likely reason - perhaps the Pyramid was built by a very advanced human civilization, whose intellect was far above our intellect at the moment. And why human? Because a pyramid is, nevertheless, built from separate elements (vs. a monolithic structure) - in this case mainly separate stone blocks. I believe that if the creator were a more powerful alien intellect, the construction would have been monolithic. This is in accordance with the laws: "The more powerful the intellect is, the more significant its material creations are," and "The more significant its material creations, the longer it lasts". We continue to wonder how the pyramid was built. We even tried to envision how we would build it with our current technological and technical capabilities. But the evidence is clear - we cannot build it at the moment, not to mention the ancient Egyptians. For now, we can only study the Heops Pyramid and interpret its true purpose. But this pyramid is not the only signposts - there are many other as well. To mention a few:

The pyramids in South America;

A unique massive basalt construction with a total weight of more than 250 million tonnes in the capital Ponpey at the Nan Modol archipelago located between Japan and New Guinea;

The amazing platform found at Baalbek, Lebanon: The main platform is made of the world's largest stones (Baalbek's famous hewn stones). Some of these stones are 25 meters long and 4.5 meters thick and are estimated to weigh between 1,200 and 1,500 tonnes each;

And many other...

These studies show strange, unexpected and now unexplained results. For example, it is clearly proven experimentally that the pyramidal structure concentrates unfamiliar form of energy that has beneficial effects on all organisms, including plants, animals and humans. Pyramidal structures are even used for biological wastewater treatment. What is the reason? Clearly, this is a new energy field, similar in nature, but separate from the electromagnetic and gravitational fields we know. Some scientists even assume that the Heops pyramid was built to increase the background energy fields of the Earth at a subatomic, quantum level.

Dear reader, enough facts. Let's now assume that a powerful ancient human civilization, or, more precisely, a powerful ancient intellect has created these artifacts. Why do I call them "signposts along the road"? Because, I believe, the ancient intellect has created these artefacts to mark the way that our intellect should follow. I believe that the artefacts are built in such a way that they can synchronize with each stage in our intellectual development to be consistent with what we can understand at each stage. For example, for the ancient Egyptians, the pyramid could only be a royal tomb. At a conscious level, they could not perceive anything else. At the subconscious level, however, it has had a powerful impact on them, which has guided them on the way forward in every respect.

This is the intellectual "guide", which, emanates from the pyramid and, I guess, reaches as far as thousands of kilometers around it. Probably all major artefacts have had similar roles in the past, have today, and will continue to have in the future. At the present stage of our development, we are already specifically detecting this radiation, and are able to measure it, but we can not yet decode its messages. Probably this will happen in the not too distant future. And

when it happens, it will be the turning point in the development of the human intellect on the path to something better. And, more importantly, the intellect of our civilization will, for the first time, be able to make full contact with another intellect. And what comes after I can't imagine. But one thing is for sure - that we will build the artefacts that will be the signposts to guide our successors.

Dear reader, what do you think? Is this possible? One more thing - the artifacts I'm referring to remind me of giant computers!
