Abstract: The process parameters optimization is the essential step in Taguchi approach, which utilizes orthogonal array for maximizing the effect of controllable parameters and for minimizing the effect of uncontrollable process parameters. This study presents optimal parameters that influences on the BP, BSFC, CO, HC, NOx using Taguchi method. The 3 level 4 factor design has been considered they are Torque, Injection pressure, Timing, Fuel. The L9 orthogonal array is employed and signal-noise ratio (S/N ratio). Larger is better type is employed for BP and smaller is better type has been employed for BSFC, CO, HC, NOx and analysis of variance, (ANOVA) are considered for identifying the best optimum conditions.

Keywords: BP, BSFC, CO, HC, NOx, Torque, Injection pressure, Fuel, Timing and ANOVA, Taguchi approach

1. Introduction

Performance parameters and the emission characteristics of the CI engine has been considered and here 3 level 4 factors design has been considered in the taguchi analysis. Taguchi analysis has made to know which factors influence more on the emission and the performance parameters. Anova is made to know about the error in the performance. Taguchi has used to make the calculations simpler for more parameters.

Taguchi Experiment: Design and Analysis

The simulation tests were carried out as per the standard L9 orthogonal array. The various factors taken for the calculation were Torque, Injection pressure, Fuel and Timings. Each factor was provided with three levels as displayed in Table 1.

 Table 1: Factors and level for Emission and Combustion characteristics

| Factors | Level 1 | Level 2 | Level 3 |
|--------------------|----------|----------|----------|
| Torque | 6.5 | 13 | 19.5 |
| Injection pressure | 200 | 250 | 300 |
| Fuel | 0* | 10** | 20*** |
| Timings | 16 (RTD) | 21 (STD) | 26 (ADV) |

*= Neat diesel

**= 10% biodiesel

***= 20% biodiesel

 Table 2: Orthogonal array of Taguchi and Signal to noise

 ratio for BP

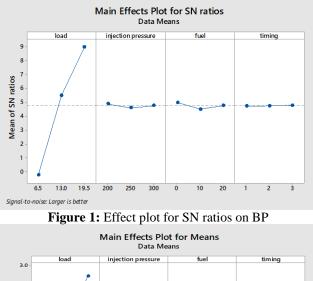

| Torque | Injection pressure | Fuel | Timing | BP | SNRA1 |
|--------|--------------------|------|--------|-------|----------|
| 6.5 | 200 | 0 | 16 | 0.978 | -0.19322 |
| 6.5 | 250 | 10 | 21 | 0.908 | -0.83828 |
| 6.5 | 300 | 20 | 26 | 0.978 | -0.19322 |
| 13.0 | 200 | 10 | 26 | 1.871 | 5.44148 |
| 13.0 | 250 | 20 | 16 | 1.943 | 5.76946 |
| 13.0 | 300 | 0 | 21 | 1.924 | 5.68410 |
| 19.5 | 200 | 20 | 21 | 2.841 | 9.06942 |
| 19.5 | 250 | 0 | 26 | 2.839 | 9.06331 |
| 19.5 | 300 | 10 | 16 | 2.692 | 8.60150 |

The high S/N ratio gives the optimal quality and has low variance using the MINITAB software. Larger is better type has chosen and the similar response was used for signal to noise ratio. It shows that for higher torque value the SN ratio is higher i.e for higher torque the value of BP is higher.

The S/N ratio is analyzed by using the equation

$$s/N = -10 \log_{10}(\frac{1}{n}\sum 1/y^2)$$

Result and discussion for BP

Analysis of variance (ANOVA)

It can observed from the ANOVA analysis that the torque(71.74%), injection pressure(13.096%) and fuel(15.016%) have the influence on BP. The last column of table shows the percentage contribution of each parameter on the total variation representing their degree of impact on the result. The Torque (71.74%) and the fuel (15.016%) has the greatest influence on the BP while the injection pressure has the least influence on the BP.

Analysis of Variance

| Analysis of variance | | | | | | | |
|----------------------|----|---------|---------|---------|---------|-------------------|--|
| Source | DF | Adj SS | Adj MS | F-Value | P-Value | % Contribution | |

Analysis of variance (ANOVA):

ANOVA is a statistically built, objective judgement-making tool for identifying any dis similarities in the average performance of groups of items that were verified. ANOVA aids in analyzing the importance of all-required factors and their interactions by matching the average square against an Estimate of the experimental errors at specific confidence levels. This analysis was conducted for a level of significance of 5% (that is the level of confidence of 95%). Table 4 displays the ANOVA

| Total | 8 | 60118 | | | | 100 | | |

It can observed from the ANOVA analysis that the timing (55.6422%) has the more influence on NOx. The last column of table shows the percentage contribution of each parameter on the total variation representing their degree of impact on the result. The torque (9.90%) and Timing (55.6422%) has the greatest influence on the NOx and other factors have negligible influence on NOx.

2. Conclusion

The present paper experimental investigation on the performance parameters by Taguchi method:

- It is observed that the Torque influences more on the BP compared to the other parameters. The contribution of torque on the BP is 71.74% in compared with the other parameters by ANOVA.
- It is observed that the Torque influences more on the BSFC compared to the other parameters. The contribution of torque on the BSFC is 73.24% in reference with the other parameters by ANOVA.
- In CO the influence of the Injection pressure is more in compared with the other parameters. Injection pressure contributes 45% on CO compared to other parameters by ANOVA.
- The influence of torque is more on the HC compared to other parameters. The Torque influences 62% compared to other parameters by ANOVA.
- Timing influences more on the NOx compared with the other parameters. Timing has the influence of 63% on the NOx by using ANOVA.
