Student Teachers’ Reflections on Prior Experiences of Learning Geography: A Kenyan Example

Timothy Walela Maonga
Department of Educational Communication and Technology, University of Nairobi, Kenya

Abstract: Geography in primary schools in Kenya is taught as part of social studies. In Teacher education it is still part of social studies. The importance of prior experiences in the development of student teachers has long been recognized and there is growing evidence of the nature of those experiences in areas such as geography. This paper reports the findings of research conducted with five cohorts of primary teacher trainees (student teachers) in seventeen primary teacher training colleges in Kenya. The study explored the prior experiences of student teachers as learners of geography and their perceptions of the subject. While there were differences between student teachers from different training colleges, attitudes towards geography were predominantly positive. Positive experiences focused on interesting and enthusiastic teachers and active and participatory learning approaches. Negative experiences of geography centred on the dominance of textbook-based teaching and the requirement to memorize content. The article argues that by providing positive and negative images of practice in the teaching of geography, students’ prior experiences can prompt insight into practices that promote deep learning, facilitate the integration of the personal and the professional dimensions of teaching and provide a starting point for the development of a vocabulary of critique and evaluation.

Keywords: geography; teacher education; prior experiences; attitudes

1. Introduction

Geography in primary schools is taught as part of social studies (MoE 2002) it is examined as part of a paper of social studies and religious studies (MoE 2002). It forms part of the social science syllabus which has history and civics. Primary teacher education in Kenya takes two years after secondary education. In the second year of primary teacher education, student teachers specialize either in the science or social sciences components of the course. Those who special in social sciences teach the arts based subjects in primary schools from standard 1 to 8. It is noted that teacher trainees who did KCSE in geography are the ones who opted to take it as an elective subject. It is also noted that the rest of the teacher trainees who opt to take the social science option, studied geography up to form 2. Having taken the social science option in teacher training in second year, they will then have to teach social sciences at the primary schools which includes geography.

This study is a longitudinal study that stretched from 2010 to 2016 in 17 public primary teacher training colleges. A total of 1200 student teachers participated in the study. They are categorized as those who entered the college with a KCSE grade in geography and those who did not have a KCSE grade in geography.

All Colleges in Kenya share an approach to primary geography that is based on the ideas of enquiry, a social constructivist approach to children’s learning and a concern with the development of pedagogical content knowledge (PCK) as stated by Waldron et al., in 2009. The concept of PCK was developed by Shulman in 1986 and had a significant impact on teacher education. He defined ‘subject matter for teaching’ based on the idea that there is a particular domain of teacher knowledge at the intersection between subject knowledge and peda-gogical knowledge. Notwithstanding the approach adopted by teacher educators in the different colleges, the curriculum and the examinations are similar.

The study as mentioned earlier, is a longitudinal study for period between 2010 and 2016. This study was conceived as part of a wider inquiry into teacher training with an aim of promoting critical reflection evaluation and review. The study was conducted in the spirit of promoting the dialectical relationship between research and practice, which is part of what it means to be a teacher educator (Cochran-Smith, 2005). While the longitudinal study focused on history, geography and civics, this paper draws on some of the data collected in relation to geography.

2. Literature Review

Many scholars who handle reflection on prior experiences have identified it as a critical component of teacher education program. (Calderhead, 1988; Chan, 2004; Fajet, et al 2005). Others recognise the complex and dynamic relationship between prior experiences, perceptions and subsequent practice (Haritos, 2004; Korthagen, 2004; Martin, 2000, 2006; Sugrue, 2004; Tann, 1993; Tillema, 2000; Younger, Brindley, Pedder, & Hagger, 2004). While earlier research suggested that the relationship between student teachers’ beliefs and their practice as teachers bordered on the deterministic (Kagan, 1992), recent studies have suggested a range of relationships that are more fluid. Levin and He in 2008 found student teachers’ beliefs to be subject to both continuity and change and influenced by a combination of prior experiences, teacher education coursework and classroom experience. In the context of geography, research into student teachers prior experiences have focused, inter alia, on students’ perceptions and preconceptions, on subject knowl-edge and its implications and on the influence of school settings on practice (Barratt Hacking, 1996; Catling, 2004; Corney, 2000; Martin, 2000, 2006; Morley, 2012). However, Catling (2013) highlights the need for more intensive research in approaches to...
primary geography, including curriculum development, experiences of student teachers in primary teacher education, and the level of subject-specific knowledge required to teach at primary level.

As with other subjects, the level and nature of subject expertise required in order to teach geography well and the implications arising for initial teacher education have been problematical. As Catling and Morley (2013) states that the wide range of subjects taught by primary teachers suggests that PCK (Shulman, 1986) may provide the best lens through which to view the question of subject knowledge. Indeed, pointing to the complexity of the relationship between subject knowledge and pedagogical knowledge, Martin’s (2004) study of student teachers found that disciplinary expertise in geography did not necessarily confer an advantage in relation to teaching and suggests that all student teachers are novice teachers in the context of primary geography, regardless of their disciplinary background. Questioning whether student teachers were more influenced by their images of teaching than their prior experiences as geographers and their perceptions of geography, Martin argued the need for student teachers to interrogate perceptions of teaching and learning as well as images of geography; in addition, she proposed opportunities for student teachers to explore the nature of geography, its role in society and its benefit to children’s development (Martin, 2000). Subsequent studies by Martin explore the potential of teachers’ personal geographical knowledge, their ‘everyday’ geography as a source from which their conceptual knowledge can be developed (2005, 2008). She has proposed the term ‘ethnogeography’ which highlights the geographical knowledge available to all learners because of each person’s personal geographical knowledge (Martin, 2005). Ethnogeography reflects the view that all students (including student teachers) are geographers because they all live in the world, interacting with a variety of landscapes (human and natural) on a daily basis.

3. Methodology

This paper is based on data gathered from a longitudinal study. A three-phase study was designed in order to provide data on the changing views of student teachers as they progressed through their PTE programmes. The study consisted of an entry and exit questionnaire and a series of mid-project focus group interviews with 1200 students from the sample population. While the complete study involved an exploration of student teachers’ attitudes to and experiences of learning and teaching history, geography and civic, this paper reports specifically on qualitative elements of the geographical data from the initial survey.

The study was designed as a non-random study. The target population was all PTE students entering public colleges for Primary Teacher Education course in Kenya for the 5 years. (2010, 2011, 2013, 2014 and 2015) The questionnaire was distributed among first year Teacher Trainees in all 17 Teacher Training Colleges. The students were divided into a half, that is 600 who sat for KCSE in geography and 600 who did not sit KCSE in geography. An average of 86% of the 1200 students responded to the questionnaire, i.e. 87% of those who sat for KSCE in geography and 85% of those who did not sit KSCE in geography. The questionnaire gathered biographical data, information about students’ own knowledge base, attitudinal data relating to geography and qualitative data regarding their school experiences and their conceptions of what makes a good teacher.

This paper draws on the qualitative data gathered in response to open questions regarding student teachers’ school experiences which prompted respondents to give an account of their positive and negative experiences as learners of geography. Responses to the open-ended questions were entered into a Microsoft Excel database and were sub-j ected to a grounded analysis using the constant comparative method (Bryant & Charmaz, 2007; Glaser & Strauss, 1967). In asking respondents to recount their most positive and negative experiences, the researcher sought to go beyond a generic description of ‘everyday’ geography to elicit focused responses which included some level of judgement on the part of the respondents on what constituted a positive and a negative experience of geography. It is acknowledged that by focusing on the extremes, the experiences gathered could be seen to be atypical. Furthermore, as short, spontaneous responses to questions, the accounts are limited by their length and by their spontaneity, which allows little opportunity for reflection and development.

This paper addresses the following research questions:

- What are student teachers’ prior experiences as learners of geography?
- What conceptualizations of geography are embedded in their experiences?

4. Findings

The findings are laid out in response to the two research questions. The knowledge profile of the students is presented initially to contextualise the respondents and the experiences they recounted.

Student teachers knowledge on Geography at the time of entry

While, as noted earlier, student teachers’ capacity to teach geography is not determined by their level of qualification in the subject, the idea of having sufficient knowledge with which to begin the process of developing PCK justifies some focus on student teachers’ formal education in the subject prior to entry into PTE. The entry questionnaire, therefore, included questions on the highest levels of qualification in relation to whether you did geography at KSCE or not. Those who did not take geography in forms 3 and 4 did not have grades in geography at KSCE, while those who did geography had grades ranging from A to E. All groups of student teachers had prior experiences learning geography, though the ones who did geography at KSCE had a longer experience than those who stopped at form two. As Table 1 indicates, the percentage of respondents who did not sit for geography in the national examination ( KSCE) was lower than those who did geography. For 49.48% of who did not do geography, while over half (50.58%) of who did geography at KSCE.

As indicated earlier, there are those student teachers stopped learning geography at form 2 and those proceeded to form 4. While the education system in Kenya provides for a broad range of subjects to be taken up to form 2, it then supports greater specialisation in a narrow range of subjects at form 3 and 4. Overall, the data indicated that student teachers were entering PTE with a reasonably high knowledge base in geography.

Prior experiences of learning geography

Students were asked to recount their positive and negative experiences as learners of geography. The overwhelming majority of students (79%) identified one positive experience, while almost one in three (30%) provided positive experiences only. Ninety percent of those who learned geography up to form 4, identified one positive experience, while fifty five percent of those who stopped learning geography at form 2 identified one positive experience. Sixty-five percent of students learned geography up to form 4 recounted some negative experiences of learning geography as compared to eighty five percent of those who stopped learning geography in form 2. With 6% indicating a total negative experience. A further 5% failed to respond to the question. When the data were analysed, three main categories of prior experiences emerged as follows: those related to teaching and learning environments (i.e. teaching approaches and classroom environment); teacher characteristics (personal and professional qualities of teachers) and perceptions of the subject (subject-specific comments). Perceptions of geography attracted the largest volume of positive and negative comments (84% and 43%, respectively), with teaching and learning environments constituting the second largest grouping (58% and 32%, respectively) and teacher characteristics comprising the smallest grouping (10% and 7%, respectively).

Perceptions of Geography

All students were asked to write about how they perceived geography. They remembered in general some of the concepts, skills, and some values, others recounted the joy they went through fieldwork and the difficulties of dealing with maps. This was further confirmed by the positive and negative experiences recounted that gave some insight into their conceptualisation of the subject and into their underlying attitudes towards geography. They identified a range of concepts, approaches to teaching and areas of learning, which they considered to be specifically geographical.

In terms of the areas of geography highlighted by the students, physical geography was the branch mentioned most frequently by name (17%) with additional multiple comments relating to rivers, mountains, volcanoes and earthquakes. Others (11%) associated geography with learning about other countries and (5%) associated geography with learning about other cultures, while 3% recounted positive experiences which identified geography with nature and environmental awareness. Fewer (3%) saw geography as having an explicitly local focus.

Below are the sets of questions and how they were responded to:
Your experiences of geography (Please give examples of your most positive and negative experiences). You may include experiences from primary and secondary schools.

I loved the nature trails we did at primary level. It instilled a great love and awareness of our environment. Our teachers would let us all grow small plants and we would see at first hand the true meaning of why water was needed for the plant to grow etc.

Field trips, local relevance. Fun, interesting classes. Map reading/investigation was interesting and useful.

Fieldwork emerged as the most frequently referenced positive experience of geography. Cited by 43% of the students, it could be argued that it was seen by the students as the signature mode of geographical investigation, while the use and construction of maps and diagrams was also seen as characteristic. However, some caution is required with regard to this interpretation. In some cases, it was evident that students were referring to a single, memorable example of fieldwork, while in others it represented an ongoing, characteristic practice. Nonetheless, its strong presence was a notable feature of the data and points, at the very least, to it being part of students’ conceptualizations of what it means to do geography. Fieldwork will be returned to in the next section.

While not explicitly asked to consider the purpose of geography, issues of value and relevance were embedded in a small number of responses. Some students (5%) saw geography as useful and relevant to everyday life and a source of transferable skills such as map reading. Through geography you could engage with ‘issues important in the world today such as future power resources, global warming, recycling, etc.’ and come to understand why the earth is why it is’.

We didn’t learn of other cultures, just the names of places. We learnt off things but didn’t learn much about them.
Have always disliked the subject and in fact I’m not 100% sure what is involved apart from maps and locations.

I never liked geography. I always felt it was about maps, contour lines, etc. The teacher wasn’t good at holding the class’s interest.

As the quotes above exemplify, perceptions of geography were also embedded in students’ accounts of negative experiences. Experiences of this nature are characteristic of rote learning approaches to geography whereby students commit long lists of geo-graphical facts to memory. As noted earlier, this characterisation is predominantly associated with the experiences of all students.

There was a bit too much learning and facts, especially in Leaving Certoue. Would have liked more practical work. Learning large amounts of rivers, countries capitals, towns etc. by heart to regurgitate for test on Friday and once test was over forgetting them completely. Inevitably, students’ own attitudes towards the subject infused the qualitative data. In many cases, these attitudes were tied to specific experiences of teaching approaches.

As noted earlier, fieldwork emerged as the dominant positive experience with over 4 in 10 student teachers recalling different examples of work outside the classroom in the local area or in sites distant from the school. The capacity of fieldwork to enliven the learning experience, to make it more memorable and more enjoyable was noted by sev-era. Indeed, student experiences in this regard echo to some extent research findings in the area. A review of research into outdoor learning, for example, found ‘substantial evidence’ that fieldwork, if well-planned and purposeful, promotes cognitive and affec-tive development (Rickinson et al., 2004).

Many field trips and outings, this helped me to learn and progress at a quicker rate.

We completed fieldwork in secondary school and this was a good experience, it allowed us to experience first hand the geography of Ireland; it is easier to understand when you see it at first hand rather than just in text books.

Other modes of practical or group activity such as project work (6%), making or reading maps (12%), creating diagrams, problem solving and engaging in discussion and debate were also referenced positively in terms of their capacity to promote learning and understanding, as well as their enjoyable character. Implicit in several of these responses was the idea of agency of having opportunities to contribute their opinions and have them heard.

As noted earlier, fieldwork emerged as the dominant positive experience with over 4 in 10 student teachers recalling different examples of work outside the classroom in the local area or in sites distant from the school. Implicit in several of these responses was the idea of agency of having opportunities to contribute their opinions and have them heard.

Doing project work, team work made different topics easier to understand.

We did lots of projects on different topics and countries and learned a lot from this and it was fun doing them as we worked in groups. We got to draw things like maps and diagrams so it wasn’t all theory.

Loved the challenging debates on better/worse in human nature.

Class discussion. Coming up with our own explanations/ solutions for a particular problem or question.

Fieldtrips surfaced again in the recounting of their negative experiences (3%), though largely in the form of complaints that fieldwork experiences were too infrequent or were not provided. In terms of their negative experiences of geography, 35% overall focused on negative aspects of the
teaching and learning environments they encountered, identifying particular teaching approaches that they disliked. Location mattered, with 23% to 43 percent of students from different colleges making negative comments relating to teaching methodologies. Students recounted spending large amounts of time reading textbooks, listening to textbooks being read by teachers, learning by rote, writing notes and copying material from books. Indeed, almost one third of all students who commented on negative experiences identified rote learning of textbooks, notes and lists of physical features as characteristic experiences. This was predominantly a concern of the students who did not do geography at KSCE (with only a handful of those with geography at KSCE) mentioning a similar experience. The majority of comments related to the ‘learning off’ of lists of rivers, mountains, lakes and towns as part of their primary geography experience, and the need to memorise essays and textbooks in preparation for examinations.

I loved geography in primary school; however, learning off the towns and rivers in Ireland by heart was stressful and I don’t really remember them today.

Learning pages and pages of useless notes. Learning pages off by heart rather than knowing the content.

Textbook-dominated teaching was specifically identified as an issue by 70 respondents, mostly from second group, while some found the work to be unchallenging and lacking in creativity. For others (7%), map work was considered to be either boring or difficult.

Did hardly any in primary school, and in secondary school, it was all just text book so it was boring. KSCE Cert standard isn’t challenging enough.

Never settled in a geography class. Didn’t enjoy it, could never read maps or any other types of graphs and tables. Found it very boring at secondary level and never looked forward to the class.

In summary, students valued participative, collaborative and enquiry-based approaches to geography which they saw as more enjoyable and more conducive to learning. While both groups identified the requirement to memorise as an issue, textbook-dominated lessons and rote learning of texts and lists of physical features was more evident in those who had no geography at KSCE. The lack of creativity and challenge in much of the work required of students was seen as a disincentive to learning.

Teacher characteristics
Your ideas about teaching primary school geography (What do you think makes a good teacher of primary geography)

For some respondents (12%), the personal and professional qualities of their teachers had a significant positive influence on their experiences as learners of geography. Students used a wide range of terms to describe their teachers in this regard, such as ‘interesting’, ‘enthusiastic’, ‘great’, ‘brilliant’, ‘excellent’, ‘dynamic’, ‘motivated’, ‘dedicated’, ‘kind’ and ‘helpful. Teacher was really lovely and kind. She didn’t shout if you don’t know something. She understood that not everyone loved geography. Professional characteristics, such as the ability to motivate, to explain and to plan interesting experiences, were valued.

Every student was interested because the teacher engaged with the class and provided us with, believe it or not, facts which were very interesting. Had a great teacher that helped me when having trouble and explained things well.

One student noted how the teacher integrated her/his personal experiences of geography into the classroom work. Teacher explained things quite clearly. Told us about their own experiences of seeing certain geographical sites etc.

Teachers were also described as having a negative impact on student learning and motivation to study geography. Using terms such as ‘boring’, ‘unenthusiastic’, ‘awful’, ‘poor’ and ‘uninterested’, almost 1 in 10 responses exemplified passive learning experiences, led by uninterested teachers whose teaching style rarely varied: Possibly the worst teacher I ever had for Leaving Certificate. His level of enthusiasm, interest and drive was abysmal; he really didn’t inspire us to work hard or to study.

Paradoxically, too much passion was also cited as an issue, while others recounted experiences where a teacher’s level of classroom control whether overly strict or lax led to unproductive or uninteresting lessons. Teacher so passionate about geography didn’t understand that you could have a difficulty, endless map drawing, found it very difficult. We had one teacher who used to donate all of her time to the unruly pupils. I found this very unfair. I remember asking her to show me how to read Ordnance Survey maps and she never came to me.

It is evident from the data that students recognize the affective and relational character of teaching and learning, and the personal and professional dimensions of teacher identity. The role of teachers as caring professionals whose practice has a significant impact on students’ well-being is well drawn in the data, while the interaction of teachers’ interest in geography with student motivation to engage with the subject is strongly present.

5. Discussion
Geographical Knowledge base of student teachers

While it is evident that the geographical knowledge base of student teachers within both jurisdictions varies from deep engagement to little or no engagement with previous for-mail education programmes, all students who constructed accounts of their experiences displayed some geographical knowledge. Over half of those who had geography at KSCE and one in three student teachers in first cohort had reached the highest level of qualification available in the system prior to entry into teacher training. This indicates a substantial core group of PTE students in both groups with significant experience in geography. On the other hand, half of student teachers had an experience of geography beyond primary level and up to form 2 while a similar proportion of students formally study of geography up to form 4. This
mixed knowledge base raises challenges for teacher educators working with groups of student teachers. How can teacher educators build on the wealth of formal knowledge which exists in some cases, while addressing its absence in others? Could it also be argued that, despite or perhaps because of their experiences of geographical learning in a formal context, the majority of student teachers on entry exhibit understandings of geography that run counter to what is needed in order to teach geography well?

In her study of English primary student teachers, Morley found their perceptions of geography to be narrow and predominantly information oriented (Morley, 2012). She cautions, however, that among other things, the research does not take into account how participants experienced geography. Analysis of student experiences as recounted in the data presented here would suggest that while many students experience geography as largely concerned with the memorization of information (either in the form of lists or in the form of textbook content), there are indications also of a broader experience of ‘doing’ geography along with some underlying critique of an information-oriented approach to geography, at least in terms of modes of engagement. On the other hand, relatively few students articulated a view of geography as concerned with processes and relations or with explaining the world. Using the three forms of geographical knowledge identified by the Geographical Association (2011) and used by Catling and Morley (2013) in relation to teachers’ knowledge frameworks, students’ comments contained multiple references to limited elements of ‘core’ geographical knowledge (areas commonly identified as the content of school geography) and exhibited some fragmented understanding of ‘procedural’ knowledge through their recognition of fieldwork as a sig-nature mode of geographical investigation. However, there was very little evidence that students had incorporated the conceptual or generalisable knowledge identified in the typology as ‘content’ knowledge. Despite the evident limitations of their perceptions of geography, and taking on board the bias towards information-oriented conceptualizations, the sense of geography exhibited by the students collectively provides a starting point, an emergent understanding, which, similar to and consonant with Martin’s ethno-geographies (2005) offer a context for development in PTE.

A question of practice?

In terms of critique of the system, the study corroborates much of what is known about Kenyan education at first and second level. Consistent with the findings of a range of studies, textbooks and textbook-based teaching continue to exert significant influence on childrens and young people’s experiences as learners at primary and post-primary levels (Eivers, & Cheevers, 2006, Republic of Kenya 2010; NCCA, 2008a, 2008b). While both groups of students shared concerns relating to rote learning of factual information and the negative influence of examinations on classroom experiences, they were more characteristic of the negative experiences of the non geography at KSCE. This tendency towards passive learning experiences is reflected in a number of studies whose findings suggest that Kenyan like Irish teachers engage far less with active learning and student-oriented practices, such as group work and projects than teachers in other countries (Cosgrove, Gilleece, & Shiel, 2011; Shiel, Perkins, & Gilleece, 2009).

What is interesting here, however, from the perspective of PTE, is not that student teachers’ experiences have been characterised in many cases by passivity or dominated by rote learning or textbooks, though knowledge of those experiences for teacher educators is essential. Rather it is that having had these experiences, even where they were not also balanced by the positive experiences of active learning, geographical investigation and supportive teachers, many student teachers recognized the consequences in terms of superficial learning and student alienation. If meaningful and ongoing opportunities are provided within PTE for students to deconstruct their experiences and to use them and reuse them as touchstones for critique then, rather than providing obstacles to their development as teachers, these experiences and the learning that derives from them could facilitate transformative reflective practice.

6. Conclusion

The idea of interrogating preconceptions has become an accepted practice in initial teacher education. It is justified historically by the argument that the student teachers' beliefs and experiences as learners can lead them to reject the more innovative and challenging practices of PTE when faced with the challenges of the classroom (Calderhead & Shorrock, 1997), an argument that has led to PTE being characterised as a ‘relatively low impact enterprise’ (Tann, 1993). However, the evidence here suggests that, while student teachers may at times conflate acquiring information with learning, they can articulate critiques of those experiences that are, in many cases, productive and insightful and demonstrate an emerging framework and vocabulary of critique which can serve as a starting point for self and peer evaluation. It can also, and perhaps most importantly, serve as a springboard for the deconstruction of school culture relating to the teaching of geography, a factor which has been identified as a powerful influence on student teachers’ capacities to implement the pedagogical approaches endorsed by PTE(Barratt Hacking, 1996). Furthermore, the study suggests that student teachers begin their teacher education with a deep sense of the importance of the person of the teacher and the affective dimensions of teaching and learning, recognising the agency of teachers in the construction of learning environments and the negative impact of passive and disempowering environments on student learning. In the context of the reconceptualisation of geography education courses in PTE currently underway in Kenya these findings offer several points of departure for the enhancement of initial teacher education programmes, linking prior experiences and personal geographical knowledge or ethnogeographies (Martin, 2005) and developing students’ nascent frameworks of critique through an iterative reflective process.

This study also provides an insight into student teachers’ experiences of and perceptions of geography that contribute to the growing evidence base in the area. While per-haps limited by its focus on positive and negative experiences which may be atypical of students’ more general experiences and by the spontaneity of the responses collected, which do
7. Recommendation

While the experiences recounted by student teachers placed more emphasis on the actions of teachers than on their personal characteristics, there was, nonetheless, considerable recognition of the influence of the teacher as person and as professional on the quality of learning in geography. Students recognised the interaction between teachers’ personal qualities such as kindness and enthusiasm, professional qualities relating to interest in geography and the capacity to plan and to manage, and the affective and cognitive dimensions of their experiences as learners. The need to enable student teachers to integrate their personal and professional identities as teachers through reflection and to place a sense of mission at the core of teacher identity has been strongly argued as a key component of teacher education (Korthagen, 2004, 2012). In addition, there has been a growing recognition of the relevance of the feminist ethic of care to educational practice (O’Brien, 2012). This approach foregrounds the need for teacher education to promote a caring, relational and dialogic practice, if student teachers are to emerge as professionals capable of promoting human flourishing through humanising education (Noddings, 2003; O’Brien, 2012). Students’ prior experiences as learners of geography and their recognition of the role played by the person of the teacher in defining those experiences provide a rich context for that integrative process to begin.
