Effect of Osteoarthritis of Knee Rehabilitation on Pain & Function on Quality of Life

Dr. Alpa Purohit1, Dr. Sweety Shah2

1(MPT orthopaedics), PhD scholer of Gujarat university, Sr. Lecturer at Ahmadabad institute of Medical Sciences, Ahmedabad, Gujarat

2Sr. Lecturer ,PhD. Guide,SBB Physiotherapy College, V.S. Hospital, Ahmedabad

Abstract: Purpose: Patients with knee osteoarthritis tend to increase their physical limitations, pain and functional restriction with disease progression. Thus, these individuals suffer from progressive increased impact on their activities of daily living, which leads to losses in labor relations, leisure, social life, and sleeping quality, leading also to important decrease in their quality of life. So the need arise to measure important aspects of patients' mental, social and emotional health. Health-related quality of life is encompasses emotional, physical, social, and subjective feelings of well-being that reflect an individual's subjective evaluation and reaction to his/her illness. So purpose of the study was to see the effect of osteoarthritis of knee rehabilitation on pain & function on quality of life. Most patients with OA are assessed and treated within primary care settings. We can create the awareness in the different aspect of life and specify the way of treatment.

Methodology: 30 subjects(15 in each group) were assessed as per the criteria. Group A - rehabilitation - Conventional physiotherapy was given in the physiotherapy clinic for 4 wks. Group B - Non rehabilitation(advice). SF-36 and WOMAC - Outcome measures were evaluated. Analysis: pre and post data was analyzed by wilcoxon signed ranks test and between group analysis by mann whitney test.

Result: There was a significant difference in Pain and Function in Non-rehabilitation group womac score where p<0.001; and quality of life in physical component and mental component where p<0.001.

Conclusion: The knee rehabilitation reduces the pain and improves the function and quality of life in subjects having OA knee.

Keywords: Osteoarthritis knee QOL, Pain,PCS (physical componentet summary), MCS (Mental component summary)

1. Introduction

Osteoarthritis (OA) is one of the most common causes of pain and disability in the adult population. Several studies have documented discordance between general practioners (GP) practice and management recommendations, but there is limited published information about patient reported experience of quality of care. (1) Some risk factors contribute to the appearance of the disease, such as gender, age, trauma, overuse and genetic conditions. The main tissues affected by osteoarthritis is the synovium, bone and hyaline cartilage. (2) It is a joint disease that begins with cartilage degeneration and gradually affects periarticular soft tissues and the subchondral bone, producing chronic inflammation with synovitis, osteophytosis, loss of joint space, bone remodelling and ultimately, it progresses to severe and irreversible joint destruction. (3,4) Patients with knee osteoarthritis tend to increase their physical limitations, pain and functionality restriction with disease progression. Thus, these individuals suffer from progressive increased impact on their activities of daily living, which leads to losses in labor relations, leisure, social life, and sleeping quality, leading also to important decrease in their quality of life. (5,6)

In addition to pharmacological and surgical therapies, nonpharmacological therapies, including, referral to a physical therapist, aerobic, muscle strengthening and water-based exercises,weight reduction, walking aids, knee braces, footwear and insoles, thermal modalities, and transcutaneous electrical nerve stimulation or acupuncture, are of primary importance in the management of osteoarthritis. (7)

Thus, an important outcome to be evaluated in patients with knee osteoarthritis is the quality of life of these individuals. Normally, quality of life is evaluated as the impact the disease causes to the subject. According to the World Health Organization, "quality of life" is described as an individual's perception of his/her position in life in the context of the culture and value systems in which he lives and in relation to his goals, expectations, standards and concerns. (8)

2. Aim

To find the effect of rehabilitation on pain & function on quality of life in subjects with knee osteoarthritis.

3. Objectives

• To see the effect of rehabilitation on pain & function on quality of life in subjects with knee osteoarthritis
• To see the effect of non-rehabilitation on pain & function on quality of life in subjects with knee osteoarthritis
• To compare the QOL of rehabilitation and non-rehabilitation on subjects having O.A. knee joint

4. Need of Study

Need arise to measure important aspects of patients' mental, social and emotional health. Health-related quality of life is encompasses emotional, physical, social, and subjective feelings of well-being that reflect an individual's subjective evaluation and reaction to his/her illness. So purpose of the study was to see the effect of osteoarthritis of knee rehabilitation on pain &function on quality of life. With the help of this, health-related quality of life measures we can create the awareness in the different aspect of life and as per that we can specify the way of treatment.
Hypothesis
- H0: No statistical difference between non-rehabilitation and rehabilitation group on pain and function on QOL in o.a. knee
- H1: There is statistical difference between non-rehabilitation and rehabilitation group on pain and function on QOL in o.a. knee

5. Methodology

- Data: 30 subjects
- Study Type: comparative
- Sampling: Simple random sampling

Inclusion Criteria
- Age between 45 - 65 years.
- More than grade 2 radiographic severity according to the Kellgren/Lawrence scale \(^{(9,10,11,13)}\)
- Diagnosis of moderate bilateral knee OA according to the American College of Rheumatology criteria.\(^{9}\)
- BMI less than 30

Exclusion Criteria
- Non comprehend persons
- Any other inflammatory knee disorders, previous intra-joint injection,
- Metabolic bone disease,
- History of knee trauma since last 6 month, previous knee surgery,

Procedure
Study was done in two groups.
Group A: Non-Rehabilitation (15 subjects) and
Group B: Rehabilitation (15 subjects)

As per the following criteria
Group A: Non-Rehabilitation received Ergonomic advice/HWF and
Group B: Rehabilitation received Conventional exercise protocol.\(^{12}\)

Group A
- Given ergonomic advice to patient
- Advice for hot water formentation.

Group B
- TENS(15min) for 10days\(^{14,15}\)
- QUADRICEPS EXERCISES/SQE,VMO,SLR(10 repi)
- STRETCHING EXERCISES
- Hamstrings, quadriceps, calf(10 repi)

Outcome Measures
- SF-36 \(^{(16,17)}\)
- WOMAC\(^{(18,19)}\)

6. Result

Within and between group Analysis was done by using spss16

The best treatment for osteoarthritis of the knee is prevention. Exercise therapy can improve health-related QOL, as assessed by the SF-36, of knee osteoarthritis sufferers. So, hypothesis $H_1$ is accepted and $H_0$ is rejected.

8. Conclusion

The knee rehabilitation reduces the pain and improves the function and quality of life of physical health as well as mental health in subjects having OA knee. So all the component of life are must to improve all over quality.

9. Limitation

Small sample size

10. Future Study

Different component of sf-36 statistical analysis will consider.
