

# Fixed Point Theorem for Expansive Mappings in G - Metric Space

A. S. Saluja

Institute for Excellence in Higher Education, Bhopal, M.P., India

**Abstract:** In this paper we obtain a result on fixed points for expansive type mappings in G – metric spaces. Our result includes several fixed point result in ordinary metric spaces as special cases.

**Keywords:** G- metric spaces, fixed Point, expansive mappings, etc

**Mathematics Subject Classification:** Primary 47H10, Secondary 54H25

## 1. Introduction

In 1963, Gähler [4] introduced the concept of 2 –metric spaces. In 2 –metric space  $d(x, y, z)$  is to be taken as the area of triangle with vertices  $x, y$  and  $z$  in  $\mathbb{R}^2$ . In 1992, Dhage [3] introduced the concept of D-metric space. The central concept of D-metric space is different from 2 –metric spaces. Geometrically a D- metric  $D(x, y, z)$  represents the perimeter of the triangle with vertices  $x, y$  and  $z$  in  $\mathbb{R}^2$ . However, Recently in 2005, Mustafa et. Al. [11] introduced the concept of generalized metric space called G –metric space which claims most concerning the fundamental topological structure of D –metric space that are incorrect.

To establish our main result we need the following definitions :

## 2. Preliminaries

**Definition 2.1([11]) :** Let  $X$  be a nonempty set and  $G : X \times X \times X \rightarrow \mathbb{R}^+$ , be a function satisfying the following properties :

- (G<sub>1</sub>)  $G(x, y, z) = 0$ , if  $x = y = z$ ,
- (G<sub>2</sub>)  $0 < G(x, x, y)$  for all  $x, y \in X$  with  $x \neq y$ ,
- (G<sub>3</sub>)  $G(x, x, y) \leq G(x, y, z)$  for all  $x, y, z \in X$  with  $z \neq y$ ,
- (G<sub>4</sub>)  $G(x, y, z) = G(x, z, y) = G(y, z, x) = \dots$  (symmetry in all three variables)
- (G<sub>5</sub>)  $G(x, y, z) \leq G(x, a, a) + G(a, y, z)$ , for all  $x, y, z, a \in X$  (rectangle inequality)

Then the function  $G$  is called a generalized metric or, more specifically a G – metric on  $X$  and the pair  $(X, G)$  is called a G –metric space. (throughout in this paper we denote  $\mathbb{R}^+$  the set of all positive real numbers and  $\mathbb{N}$  the set of all natural numbers)

**Definition 2.2([11]) :** Let  $(X, G)$  be a G –metric space and  $\{x_n\}$  be a sequence in  $X$ . A point  $x \in X$  is said to be the limit of the sequence  $\{x_n\}$  if  $\lim_{n,m \rightarrow \infty} G(x_n, x_m, x) = 0$  and the sequence  $\{x_n\}$  is said to be G-convergent to  $x \in X$ .

**Proposition 1 ([11]) :** Let  $(X, G)$  be a G-metric space. Then the following are equivalent:

- (i)  $\{x_n\}$  is G-convergent to  $x$ .
- (ii)  $G(x_n, x_n, x) \rightarrow 0$ , as  $n \rightarrow \infty$

- (iii)  $G(x_n, x, x) \rightarrow 0$ , as  $n \rightarrow \infty$
- (iv)  $G(x_n, x_m, x) \rightarrow 0$ , as  $n, m \rightarrow \infty$

**Definition 2.3([11]) :** Let  $(X, G)$  be a G –metric space. A sequence  $\{x_n\}$  is called a G-Cauchy sequence if given  $\varepsilon > 0$ , there is  $N \in \mathbb{N}$ , such that  $G(x_n, x_m, x_l) < \varepsilon$  for all  $n, m, l \geq N$ .

**Proposition 2([11]) :** Let  $(X, G)$  be a G-metric space. Then the following are equivalent:

- (i) The sequence  $\{x_n\}$  is a G-Cauchy.
- (ii) For every  $\varepsilon > 0$ , there exists an  $N \in \mathbb{N}$ , such that  $G(x_n, x_m, x_m) < \varepsilon$  for all  $n, m \geq N$ .

**Definition 2.4([11]):** Let  $(X, G)$  and  $(X', G')$  be two G –metric space and let  $f : (X, G) \rightarrow (X', G')$  be a function. Then  $f$  is said to be G – continuous at a point  $a \in X$  if and only if given  $\varepsilon > 0$  there exists a  $\delta > 0$  such that for  $x, y \in X$  and  $G(a, x, y) < \delta$  implies that  $G'(f(a), f(x), f(y)) < \varepsilon$ . A function  $f$  is G-continuous on  $X$  if and only if it is G –continuous at all  $a \in X$

**Proposition 3([11]) :** Let  $(X, G)$  and  $(X', G')$  be two G –metric space then a function  $f : (X, G) \rightarrow (X', G')$  is G-continuous at  $x \in X$  if and only if it is G-sequentially continuous at  $x$ ; that is, whenever  $\{x_n\}$  is G-convergent to  $x$  we have  $\{f(x_n)\}$  is G- convergent to  $f(x)$ .

**Proposition 4([11]) :** Let  $(X, G)$  be a G –metric space. Then the function  $G(x, y, z)$  is jointly continuous in all three of its variables.

**Definition 2.5([11]):** A G-metric space  $(X, G)$  is said to be G-complete (or complete G-metric) if every G-Cauchy sequence in  $(X, G)$  is G-convergent in  $(X, G)$ .

**Definition 2.6 ([11]):** A G-metric space  $(X, G)$  is called symmetric G-metric space if  $G(x, y, y) = G(y, x, x)$  for all  $x, y \in X$ .

**Definition 2.7 ([11]):** Let  $(X, G)$  be a G-metric space and  $T$  be a self mapping on  $X$ . Then  $f$  is expansive mapping if there exists a constant  $a > 1$  such that for all  $x, y, z \in X$ , we have

$$G(Tx, fy, fy) \geq aG(x, y, z).$$

### 3. Main Results

**Theorem 3.1** :Let  $(X, G)$  be a complete G-metric space and let  $T : X \rightarrow X$  be a surjective mapping. If there exists non-negative reals  $a_1, a_2, \dots, a_7$  with  $a_1 + a_3 + a_5 > 0, a_2 < 1$  and

$$\begin{aligned} & a_1 + a_2 + a_3 + a_4 + a_5 + a_6 + a_7 > 1, \text{ such that} \\ (3.1.1) \quad & G^2(Tx, Ty, Tz) \\ & \geq a_1 G^2(x, y, z) + a_2 G^2(x, Tx, Tz) + a_3 G^2(y, Ty, z) \\ & + a_4 G(x, Tx, Tz) \cdot G(x, y, z) + a_5 G(y, Ty, z) \cdot G(x, y, z) \\ & + a_6 G(x, Tx, Tz) \cdot G(y, Ty, z) + a_7 G(Tx, Ty, Tz) \cdot G(x, y, z) \end{aligned}$$

for all  $x, y, z \in X$  with  $x \neq y \neq z$  then  $T$  has a unique fixed point.

#### Proof

Let  $x_0 \in X$ , since  $T$  is surjective there exists  $x_1 \in T^{-1}(x_0)$ . Continuing in this way, we get a sequence  $\{x_n\}$ , where  $x_n \in T^{-1}(x_{n-1})$ .

If,  $x_n = x_{n-1}$  for some  $n$ , then we get  $x_n$  as a fixed point of  $T$ .

Hence, without loss of generality we may assume that  $x_n \neq x_{n-1}$  for every  $n \in \mathbb{N}$ .

From (3.1.1) we have,

$$\begin{aligned} G^2(x_{n-1}, x_{n-1}, x_n) &= G^2(Tx_n, Tx_n, Tx_{n+1}) \\ &\geq a_1 G^2(x_n, x_n, x_{n+1}) + a_2 G^2(x_n, Tx_n, Tx_{n+1}) + \\ & a_3 G^2(x_n, Tx_n, x_{n+1}) \\ &+ a_4 G(x_n, Tx_n, Tx_{n+1}) \cdot G(x_n, x_n, x_{n+1}) \\ &+ a_5 G(x_n, Tx_n, x_{n+1}) \cdot G(x_n, x_n, x_{n+1}) \\ &+ a_6 G(x_n, Tx_n, Tx_{n+1}) \cdot G(x_n, Tx_n, x_{n+1}) + \\ & a_7 G(Tx_n, Tx_n, Tx_{n+1}) \cdot G(x_n, x_n, x_{n+1}) \\ &= a_1 G^2(x_n, x_n, x_{n+1}) + a_2 G^2(x_n, x_{n-1}, x_n) + \\ & a_3 G^2(x_n, x_{n-1}, x_{n+1}) \\ &+ a_4 G(x_n, x_{n-1}, x_n) \cdot G(x_n, x_n, x_{n+1}) \\ &+ a_5 G(x_n, x_{n-1}, x_{n+1}) \cdot G(x_n, x_n, x_{n+1}) \\ &+ a_6 G(x_n, x_{n-1}, x_n) \cdot G(x_n, x_{n-1}, x_{n+1}) + \\ & a_7 G(x_{n-1}, x_{n-1}, x_n) \cdot G(x_n, x_n, x_{n+1}) \end{aligned}$$

Thus,

$$\begin{aligned} & (a_1 + a_2 + a_3)G^2(x_n, x_{n+1}, x_n) + (a_4 + a_6 + a_7)G(x_{n-1}, \\ & x_n, x_{n-1})G(x_n, x_{n+1}, x_n) \\ & - (1 - a_2)G^2(x_{n-1}, x_n, x_n) \leq 0 \end{aligned}$$

Or,

$$(3.1.2) \quad (a_1 + a_2 + a_3)t^2 + (a_4 + a_6 + a_7)t - (1 - a_2) \leq 0, \text{ where}$$

$$(3.1.3) \quad t = \frac{G(x_n, x_{n+1}, x_n)}{G(x_{n-1}, x_n, x_{n-1})}$$

Let  $g : [0, \infty) \rightarrow \mathbb{R}$  be the function

$$(3.1.4) \quad g(t) = (a_1 + a_2 + a_3)t^2 + (a_4 + a_6 + a_7)t - (1 - a_2)$$

Then by the hypothesis,

$$g(0) = a_2 - 1 < 0 \text{ and } g(1) = a_1 + a_2 + a_3 + a_4 + a_5 + a_6 + a_7 - 1 > 0.$$

Let  $k \in (0, 1)$  be the root of the equation  $g(t) = 0$ .

Then,  $g(t) \leq 0$  for  $t \leq k$  and therefore

$$G(x_n, x_{n+1}, x_n) \leq kG(x_{n-1}, x_n, x_{n-1})$$

$$\begin{aligned} & \leq k^2 G(x_{n-2}, x_{n-1}, x_{n-2}) \\ & \leq \dots \dots \dots \\ & \leq k^n G(x_0, x_1, x_0) \end{aligned}$$

Then for all  $n, m \in \mathbb{N}, m > n$ , we have

$$\begin{aligned} G(x_{n-1}, x_n, x_n) &\leq G(x_n, x_{n+1}, x_{n+1}) + G(x_{n+1}, x_{n+2}, \\ & x_{n+2}) + \dots + G(x_{m-1}, x_m, x_m) \\ &\leq [k^n + k^{n+1} + k^{n+2} + \dots + k^{m-1}] G(x_0, x_1, x_1) \\ &\leq \frac{k^n}{1-k} G(x_0, x_1, x_1) \end{aligned}$$

So,  $G(x_m, x_n, x_n) \rightarrow 0$  as  $n, m \rightarrow \infty$  and hence  $\{x_n\}$  is a G-Cauchy sequence.

Hence, by the G-completeness of  $(X, G)$  there exists  $u \in X$  such that  $\{x_n\}$  is G-converges to  $u$ .

$$\begin{aligned} \text{Let } y \in T^{-1}(u), \text{ for } n \text{ such that } x_n \neq u, \text{ we have} \\ G^2(x_n, u, u) &= G^2(Tx_{n+1}, Ty, Ty) \\ &\geq a_1 G^2(x_{n+1}, y, y) + a_2 G^2(x_{n+1}, Tx_{n+1}, Ty) + \\ & a_3 G^2(y, Ty, y) \\ &+ a_4 G(x_{n+1}, Tx_{n+1}, Ty) \cdot G(x_{n+1}, y, y) \\ &+ a_5 G(y, Ty, y) \cdot G(x_{n+1}, y, y) \\ &+ a_6 G(x_{n+1}, Tx_{n+1}, Ty) \cdot G(y, Ty, y) + a_7 G(Tx_{n+1}, Ty, Ty) \cdot \\ & G(x_{n+1}, y, y) \\ &= a_1 G^2(x_{n+1}, y, y) + a_2 G^2(x_{n+1}, x_n, Ty) + a_3 G^2(y, Ty, y) \\ &+ a_4 G(x_{n+1}, x_n, Ty) \cdot G(x_{n+1}, y, y) \\ &+ a_5 G(y, Ty, y) \cdot G(x_{n+1}, y, y) \\ &+ \\ & a_6 G(x_{n+1}, x_n, Ty) \cdot G(y, Ty, y) + a_7 G(x_n, Ty, Ty) \cdot G(x_{n+1}, y, y) \end{aligned}$$

On taking limit  $n \rightarrow \infty$ , we get

$$\begin{aligned} 0 &= G^2(u, u, u) \geq a_1 G^2(u, y, y) + a_2 G^2(u, u, u) + \\ & a_3 G^2(y, u, y) \\ &+ a_4 G(u, u, u) \cdot G(u, y, y) + a_5 G(y, u, y) \cdot G(u, y, y) \\ &+ a_6 G(u, u, u) \cdot G(y, u, y) + a_7 G(u, u, u) \cdot G(u, y, y) \\ &= (a_1 + a_3 + a_5)G^2(y, u, y) \end{aligned}$$

Since,  $a_1 + a_3 + a_5 > 0$ , therefore  $u = y = Tu$ .

Thus,  $u$  is a fixed point of  $T$ .

To prove the uniqueness, let  $v$  be an another fixed point of  $T$ , i.e.  $Tv = v$ ,

Then from (3.1.1), we have

$$\begin{aligned} G^2(u, u, v) &= G^2(Tu, Tu, Tv) \\ &\geq a_1 G^2(u, u, v) + a_2 G^2(u, Tu, Tv) + a_3 G^2(u, Tu, v) \\ &+ a_4 G(u, Tu, Tv) \cdot G(u, u, v) + a_5 G(u, Tu, v) \cdot G(u, u, v) \\ &+ a_6 G(u, Tu, Tv) \cdot G(u, Tu, v) + a_7 G(Tu, Tu, Tv) \cdot G(u, u, v) \\ &= a_1 G^2(u, u, v) + a_2 G^2(u, u, v) + a_3 G^2(u, u, v) \\ &+ a_4 G(u, u, v) \cdot G(u, u, v) + a_5 G(u, u, v) \cdot G(u, u, v) \\ &+ a_6 G(u, u, v) \cdot G(u, u, v) + a_7 G(u, u, v) \cdot G(u, u, v) \\ G^2(u, u, v) &\geq (a_1 + a_2 + a_3 + a_4 + a_5 + a_6 + \\ & a_7) G(u, u, v) \end{aligned}$$

Which is a contradiction, since  $a_1 + a_2 + a_3 + a_4 + a_5 + a_6 + a_7 > 1$ .

Thus,  $u = v$ .

Hence,  $T$  has a unique fixed point.
