Abstract: *Rape is the fourth most common crime against women in India According to the National Crime Records Bureau (NCRB). If you don't really understand perpetrators, you're never going to understand sexual violence; to purpose of this study was male sexual aggression, nonconsensual sexual behavior. Parental hormones secretion exposure on children's aggressive behavior or other parental androgenic hormone, for example, because of genetic condition or because their mother were prescribed hormones during pregnancy, have been consistently found to show increased sexuality in male juvenile play behavior .humans testosterone is elevated in males from about weeks 8 to 24 of gestation and then again during early postnatal development. The testes of male produce androgens including testosterone, beginning prenatally, these hormones act through steroid receptors to produce male-typical development of the external genital. Similar steroid receptor is present in certain brain regions, and these regions also are masculinized by androgen exposure during life. These early effect of parental androgen on fetus brain organization are thought to contribute to sex-related behaviors across the lifespan. What about the idea that rape is about power over women? According to NCRB (2018) data showed that in almost 94 out of 100 rape cases, the victim were known to the offenders.*

Keywords: Sex, Hormone, Psychology, Parental, Androgen, Testosterone, Behavior, Offence

1. Introduction

Forensic scientists have been gradually filling out a picture of men who commit sexual assaults. The inter-individual selection responsible for rape may have been direct or indirect. In the case of direct selection for rape, selection may have favored raping because rape had net positive effect on rapists' reproductive success. Despite its costs, rape increased mate number and thereby reproductive success of males. If so, there is a psychological adaptation in men for rape that is specific to rape. Because women have mate choice adaptations leading them to prefer protective mates with status and resources, as well as to prefer mates with specific physical features such as body symmetry that mark inherited health, we can infer that rape, by circumventing female mate choice, increased males' mate number in human evolutionary history. In the case of indirect selection for rape, rape is an incidental effect of direct selection for male sexual traits other than rape. More precisely, rape is a byproduct of men's adaptation for pursuit of casual, non-committal, consensual sex. This pursuit was selected because it increased male mate number and because men's investment for offspring production is minimal. Put another way, rape evolved incidentally due to direct selection for obtaining a large number of consensual partners without romantic commitment. At this point in time, we do not know which is true--whether rape reflects rape-specific adaptation or arises incidentally out of an adaptation for pursuit of consensual sexual variety that's why I suggest to this article preformationism theory which is clearly describe 'WHY MEN COMMITTED RAPE' and 'HOW ITS POSSIBLE THAT RAPE IS A NATURAL PHENOMENA'

2. Literature Review

Many researchers say, is the most realistic path toward curtailing behaviors that cause so much pain. The most pronounced similarities have little to do with the traditional

demographic categories, like race, class and marital status. Rather, other kinds of patterns have emerged: these men begin early, studies find. They may associate with others who also commit sexual violence. They usually deny that they have raped women even as they admit to nonconsensual sex. Early studies relied heavily on convicted rapists. This skewed the data, said Neil Malamute, a psychologist at the University of California, Los Angeles, who has been studying sexual aggression for decades. Men in prison are often "generalists," he said: "They would steal your television, your watch, your car. And sometimes they steal sex." More recent studies tend to rely on anonymous surveys of college students and other communities, which come with legal language assuring subjects their answers cannot be used against them. The studies avoid using terms such as "rape" and "sexual assault." Instead, they ask subjects highly specific questions about their actions and tactics. The focus of most sexual aggression research is acknowledged nonconsensual sexual behavior. In questionnaires and in follow-up interviews, subjects are surprisingly open about ignoring consent. Some of these men commit one or two sexual assaults and then stop. Others — no one can yet say what portion — maintain this behavior or even pick up the pace. The recent work of Kevin Swart out, a professor of psychology and public health at Georgia State University, suggests that low-frequency offenders are more common on college campuses than previously thought. Sexual assault it's a matter of degree, more like dosage," said Mary P. Koss, a professor of public health at the University of Arizona.

Anthropologist Craig Palmer of the University of Colorado and biologist Randy Thornhill of the University of New Mexico plan to publish a book *A Natural History of Rape: Biological Bases of Sexual Coercion*, scheduled for release in April by MIT Press. Refuting claims that rape is a crime of male domination, which has evolved as a form of male reproductive behavior. They write that social scientists

promote "erroneous solutions" to rape because they incorrectly view the crime as controlled by deviant urges to control and dominate, not by sexual desire. The scientists suggest that women should take steps to deter irrepressible male impulses by not dressing provocatively or participating in unsupervised dating. But they do not equate "natural" as good and agree that their public mission is to make rape extinct as a trait in human beings. The two contend that current thinking causes of rape fail in refusing to acknowledge that by definition rape requires sexual arousal of the rapist. For more on their work, read Scientists: Rape not about power, but sex, Scripps Howard News Service Found on the Web at: http://www.hoosiertimes.com/stories/2000/01/11/news.00011_A4_MCW80871.sto. (optional reading)

But Darwinian biological theorists remind readers that the discovery of biological bases for destructive human behaviors (such as rape) does not imply social acceptance of such behaviors. First, to say something is a product of natural selection is not to say that it is unchangeable; just about any manifestation of human nature can be changed, given an apt alteration of the environment -- though the required alteration will in some cases be prohibitively drastic. Second, to say that something is "natural" is not to say that it is good. There is no reason to adopt natural selection's "values" as our own. But presumably if we want to pursue values that are at odds with natural selection's, we need to know what we're up against. If we want to change some disconcertingly stubborn parts of our moral code, it would help to know where they come from. And where they ultimately come from is human nature, however complexly that nature is refracted by the many layers of circumstance and cultural inheritance through which it passes. Robert Wright, *THE MORAL ANIMAL*, New York: Vintage Books, 1994 at 31.

Some theorists have posited rape as a crime of property, in which sex is a commodity which is stolen from a woman by a rapist. Baker clearly describes such a theory in: Katharine K. Baker, *Once a Rapist? Motivational Evidence and Relevancy in Rape Law*, 110 Harv. L. Rev. 563 (1997).

For some, sex is a commodity, and if sex is a commodity, then taking it is theft. The definitions of lovemaking discussed above may attempt to resist the classification of sex as a commodity, but most people rarely, if ever, discuss the personal, intimate, and shared experiences of sex. We live in a culture that rarely discusses sex as anything other than a commodity. Indeed, the more objectified and commodified the conversation, the easier it is for most people --especially young people--to talk about sex. Some people are never able to talk about the intimate aspects of sex, even if they do understand them. It is hardly surprising that most young people neither talk about nor understand sexual intimacy. Instead, youths, particularly young men, are bombarded by a culture that sexualizes commodities and commodifies women's sexuality. Companies sell products by selling the sexuality of the women endorsing the product. The product and the sex are purposefully conflated. Sex is also purposefully commodified. Men can easily buy sex, even though all but one state prohibit prostitution. Men can also buy pornography and purchase tickets to peep shows.

What motivates many rapists may not be substantively different from that which motivates men who go to prostitutes or purchase tickets to peep shows. None of these acts requires mutual enjoyment or emotional intimacy, and they are all called sex. Thus, men are able to satisfy a desire for sex without having to incorporate the complexities of sexually intimate communication.

3. Literature Outcomes

Earlier some researchers study based on rape and cause of sexual offences for general purpose have been attend however past literature doesn't provide any evidence that why men do like to commit sexual offences, hyper sexuality and consensual sex, sexual aggression. They provide evidence that rape is natural phenomena but why it's natural, they don't provide any evidence. The researchers talk about 'adoption' but where its came form they don't talk about it. That's why I chose this topic let to known to the whole female cast that when the question of came from sex the male brain work differently. Abbey et al. discuss the link between alcohol use and sexual aggression. The evidence suggests that in almost 50% of the incidents of sexual aggression, alcohol has been used by one person and, most often, by both individuals. Drinking alcohol on a date establishes expectancies in men and women that can turn into self-fulfilling prophecies. According to Abbey et al., alcohol makes general role stereotypes more salient and available as excuses for inappropriate behavior. Using alcohol complicates the issue of consent. At what point in the process of moving toward inebriation is a woman no longer able to provide consent? Is drinking with a man who has expressed an interest in sexual activity a form of implicit sexual consent?

When a men who admit to keeping sex slaves in conflict zones — find a similar disconnect. It's not that they deny sexual assault happens; the crime is committed by the monster over there. And this is not a sign that the respondents are psychopaths, said Dr. Hamby, the journal editor. It's a sign that they are human. "No one thinks they are a bad guy," she said.

Indeed, experts note one last trait shared by men who have raped: they do not believe they are the problem. Because the problem is played by individually the parental hormone when the rapist was in his mother womb. According to concept of embryology and endocrinology, I like to mention here that

At the time of pregnancy the mental condition of mother accepted/bored by the mother womb male fetus. Fetal gonads develop primarily based on the presence or absence of androgen hormones, mainly testosterone, dihydrotestosterone (DHT) and androstenedione; production of testosterone and conversion into dihydrotestosterone during weeks 6 to 12 of pregnancy are key factors in the production of a male fetus's penis, scrotum and prostate. The early androgen exposure is thought to produce enduring changes in behavior of underlying brain circuits.

Teststeron levels in the fetus may be assed at delivery, via the umbilical cord or during pregnancy via the amniotic fluid. Negative thought are often the root cause of fear based

stress person. Stress activities the unborn child's endocrine system and influences fetal brain development. Children born to mothers who had intensely stressful pregnancies are more likely to have behavioral problems later in life. Backing up the expert above, another well-known expert cell biologist and neuroscientist, Bruce Lipton, Ph.D. writes 'when passing through the placenta, the hormones of a mother expressing chronic stress will profoundly alter the distribution of blood flow in her fetus and change the character of her developing child's psychology'. Positive maternal emotions have been shown to advance the health of the unborn child. Mothers' thoughts which infuse the developing baby with a sense of happiness or calm can set the stage for a balance, happy and disposition throughout life. Science is uncovering how so much of what was once thought vague in a cloud of ambiguity is actually very physical and more exact than we are usually thought to believe. Every change in the mental emotion state, conscious or unconscious, is accompanied by an appropriate change in the psychological state. Thoughts are not magical, but cause the formation of specific hormones that have very real effects on the parental body and her unborn baby. Those who are reading this now are the pioneers in a world that has forgotten our innate power. You are one of the ones who will ride front of the epigenetic wave. You are what you think. You are responsible for what you think and every moment of every day a mother's thought are creating her body and her baby.

According to neuroscientist Stuart Basten from the University of Oxford: 'if parenthood is a pleasurable-or at least tolerable-experience, the chances of deciding to produce a second or third child are surely greater. It also underwrites the chance of survival of the child'. The pleasure of being a new mother indirectly influences the perpetuation of the human species as a whole.

In addition to growth of gray matter, there are other measurable changes in the brain activity of new moms. For instance, one study demonstrates that mothers who watched silent videos of their own child produce more brain activation than those who watched videos of other babies. These regions are the amygdala and the insula-areas associated with emotional responses and theory of mind functions.

In addition, estrogen is thought to play an important role helping the fetus develop psychologically, physically and mature. Estrogen levels increase steadily during pregnancy and reach their peak during pregnancy.

Researchers have found a clue in oxytocin, a hormone released during sex. This hormone also has an effect on parental Androgen levels to fetus sex hormone. The importance of FSH in the development and maturation of the seminiferous tubules and of LH or maternal hCG on the proliferation, differentiation, and testosterone production of the Leydig cells has been defined.

4. Result and Discussion

So we can say that sexuality came from our mothers who create us but some factors there is involved to activate the hormonal behavior like social, cultural which effect our psychological stage of mind and help to activate the silent

futures of sex. All above study we see that how sexual offense came from natural phenomena but 'natural' it is no to say that it is good or unchangeable this type of human behaviors (such as rape) does not imply social acceptance of such behavior. According to social psychologist, Roy Baumeister, it's expected that your man will have a sex drive higher than women. Through a study observing sexual habits between males and females, he asserts that men are more sexual than women. "The majority of adult men under 60 think about sex at least once a day. Only about one-quarter of women say they think about it that frequently. As men and women age, each fantasize less, but men still fantasize about twice as often," he says, adding, "Men want sex more often than women at the start of a relationship, in the middle of it and after many years of it." Psychotherapist, Esther Perel, says the reason men seem obsessed with sex is that they experience it differently from women. "For women, it is more about the anticipation and how you get there. It is the longing that is the fuel for desire. Women's desire is more layered on emotion," she says. "Men don't need to have nearly as much imagination. That doesn't mean men don't seek intimacy, love and connection in a relationship. They just view the role of sex differently. Women want to talk first, connect first, then have sex. For men, sex is the connection. Sex is the language men use to express their tender loving vulnerable side. It is their language of intimacy." Still, there is such a thing as being obsessed with sex. Owen Radian of Association for the Treatment of Sexual Addiction and Compulsivity (ATSAC), explains that sexual obsession is an addiction and that like all other types of addiction, such as gambling, alcohol or drugs, it is a disease. "It is an increasingly common condition that is destroying lives just like substance addictions do," he says. "People with low sex drives get addicted to sex too and it's not just about watching too much porn, it includes any kind of uncontrollable sexual activity such as compulsively engaging in prostitution, social media driven hook-ups, exhibitionism (exposing parts of your body publicly), masturbation, serial affairs and repetitively frequenting sex environments such as strip clubs and sex shops."

The following could be signs that he is obsessed: An unhealthy love of pornography that's mostly watched in secret. Many sex addicts still masturbate even after sex. He's extremely confident sexually and sometimes slightly aggressive. He becomes very angry and uptight if you withhold sex when he demands it.

The number of forcible rapes will decrease only when women realize that rape can happen to them and when men understand what constitutes rape. Psychologically it's not possible that her male friend, her brother or another mother, her uncles, her virtual male friends also take her relation to her point of view. It's not possible that a male accept a relation of female without any sexual thought. Many women believe that illusion 'it will never happen with them'. According to NCRB (2018) data showed that in almost 94 out of 100 rape cases, the victim were known to the offenders. In 15,972 of the total cases, the offenders were either family friends or neighbor or employer or other known person, while 12,568 cases, the offenders were friends or online friends or live-in partner on pretext of

marriage.in 2,780 cases,the victims were violated by their own family members. The statistic of 2016 NCRB showed that 38,947 cases,in 36,859 cases the rapist are related to the victims while 630 cases, victims were allegedly raped by grand father,father,brother and son while in 1,087 cases. That's the reality of male brain function of sexuality.

5. Conclusion

We all are came from a women so when a female is pregnant we should to care them, take them in spirituality which give them positive vibes and stay away from sexual relation in pregnancy time cause the behavior and experience which she will facing the time of pregnancy that effect her endocrine gland which prescribe some hormone for development the fetus which decide the behavior of the baby when he/she grow up in their life. We all are connected to each other in society so society effected by us, its our societies responsibility its our own responsibility to care a pregnant women not physically also mentally and stop repism because a rapist also a human beings he not a monster he just forgotten the control power of sexual drive the main cause is the parental hormone early stages of the fetus decide destructive type of behavior. We should to do something for this ignoring concept. This article I also proposed to all female cast to known the main factor of rape behind the truth.
